Table of contents

Preface	5
1 Introduction	6
2 Syntax rules / basic things to know about R	7
2.1 Script preparation / basic setup	7
2.2 Numeric operations	8
2.3 Variables	9
2.3.1 Variable names	9
2.3.2 Basic classes of data	9
2.3.3 Indexing variables	15
2.3.4 Usage of variables	16
2.4 Functions	17
2.4.1 Function usage	17
2.4.2 Functions combined	19
2.4.3 Writing functions	21
2.5 More complex data types, created by functions	23
2.5.1 Matrix	23
2.5.2 Data frame	25
2.5.3 Tibble	28
2.5.4 List	38
2.6 Control structures	41
2.6.1 Loops	41
2.6.2 Conditions	44
3 Regular expressions	49
3.1 Intro	49
3.2 Exercise	50
4 Importing data	51
4.1 Import from text files (.txt, .csv)	51
4.2 Import from Excel	51
4.2.1 Tidy Excel files	51
4.2.2 ODS files	52
4.2.3 Excel file with units row	52
4.3 Import from SPSS/SAS	54
5 Changing structure wide <-> long	56
5.1 Example 1: single repeated measure	57

5.2	Example 2: several repeated measures	57
5.3	Example 3: long to wide	59
5.4	More examples	60
5.4.1	Step 1: Create example data:	60
5.4.2	Step 2: Transform that data to a long form:	60
5.4.3	Step 3 Transform long to wide	62
6	Grouping of variables by type / distribution / use	63
6.1	Test for Normal distribution	63
6.1.1	Testing a single variable	63
6.1.2	Testing several variables	66
6.2	Picking column names and positions	70
7	Visualize data with ggplot	71
7.1	Example data	71
7.2	Basic structure of a ggplot call	72
7.3	fill vs. color	76
7.4	Color systems	78
7.4.1	External color definitions from ggsci	81
7.5	Exporting ggplots	83
7.6	Other geoms	83
7.7	Combining and finetuning aesthetics	92
7.8	Positioning elements	100
7.9	Order of layers	105
7.10	Local aesthetics for layers	109
7.11	Faceting (splitting) plots	111
7.11.1	facet_grid	111
7.11.2	facet_wrap	114
7.11.3	Controlling scales in facets (default: scales=“fixed”)	116
7.12	Showing summaries	119
7.13	Indicating significances	124
7.14	Theme definitions / changes	129
7.15	Combining figures with patchwork	135
8	Descriptive statistics	138
8.1	Reading in data	138
8.2	Graphical exploration should start before descriptive statistics	138
8.3	Gaussian variables	139
8.3.1	Simple function calls	139
8.3.2	Combined reporting	140
8.4	Ordinal variables	142
8.5	Categorical variables	144
8.6	Summarize data	146
9	Summarize / across	150

10 Simple test statistics	158
10.1 Quantitative measures with Gaussian distribution	158
10.2 Ordinal data	166
10.3 Categorical data	169
11 Intro to lm	173
11.1 Setup	173
11.2 Import / Preparation	173
11.3 Graphical exploration	174
11.4 Linear Models	178
11.4.1 Linear regression	178
11.4.2 ANOVA	182
11.4.3 LM with continuous AND categorical IV	188
11.4.4 Model exploration with package performance	194
12 Interaction in linear models	198
12.1 No age effect, no treatment effect, interaction treatment*agegroup	198
12.2 Age effect, no treatment effect, interaction treatment*agegroup	202
12.3 Age effect, treatment effect, interaction treatment*agegroup	205
12.4 How to specify interaction in multivariable models	212

Preface

This booklet is meant as companion to my R / statistics seminars. It is NOT a complete guide to either R or statistical data analysis.

1 Introduction

There are plenty of books available, check out e.g.

[R for Data Science](#)

[Modern Statistics for Modern Biology](#)

[Modern R with the tidyverse](#)

[ggplot2: Elegant Graphics for Data Analysis](#)

Chapters will follow my usual schedule, starting from R basics, introducing ggplot, data import, data preparation and cleaning, descriptive statistics, simple test statistics, then progression to linear models (regression/ANOVA), generalized linear models with logistic regression as example, linear mixed effect models, and machine learning.

2 *Syntax rules / basic things to know about R*

This is going to be the boring technical stuff... We'll get to the more interesting topics in the next chapters.

2.1 *Script preparation / basic setup*

At the beginning of (almost) every script we define packages to be used. This could be done by either

- *checking if packages needed are installed and otherwise do so, followed by function library(packagename)*

OR

- *simplifying this using function p_load() from package pacman; if you want to create fool-proof scripts, check for pacman and install if needed.*

```
# ↑ this is the head of a code chunk
Sys.setenv(LANG="en_EN.UTF-8") # to get errors/warnings in English
if(!requireNamespace("pacman", quietly = TRUE)){
  install.packages("pacman")
}
pacman::p_load(
  conflicted, # tests/solutions for name conflicts
  tidyverse, # metapackage
  wrappedtools, # my own tools package
  randomNames # used to create pseudo names
)
conflict_scout()
```

2 conflicts

```
* `filter()`: dplyr and stats
* `lag()`: dplyr and stats
```

```
conflicts_prefer(dplyr::filter,  
                  stats::lag)
```

[conflicted] Will prefer dplyr::filter over any other package.

[conflicted] Will prefer stats::lag over any other package.

2.2 Numeric operations

```
### simple calculations ####  
2+5
```

[1] 7

```
3*5
```

[1] 15

```
15/3 #not 15:3!!, would create vector 15,14,13 ... 3
```

[1] 5

```
3^2
```

[1] 9

```
9^0.5
```

[1] 3

```
10%%3 #modulo
```

[1] 1

2.3 Variables

2.3.1 Variable names

Naming things is harder than you may expect. Try to be verbose and consistent in language and style. Commonly used are `snake_case_style` and `CamelCaseStyle`.

Decide about computer-friendly (syntactical) or human-friendly names, illegal names can be used inside backticks: ‘measure [unit]’. My preference is syntactical for script variables and humane for data variables, e.g. column names, print labels etc.

There are rules for valid syntactical names:

- `UPPERCASE` and lowercase are distinguished
- start with letter or symbols as `.__`, but not with a number
- no mathematical symbols or brackets allowed

To store some value into a variable, use the assignment operator `<-` ; while it possible to use `=` or `->` , this is rather unusual. Assignments are silent, so either a call of the variable, or `print()` / `cat()` function are needed to inspect. Alternatively, put brackets around assignment: `(varname <- content)`.

```
### Variable names #####
test <- 1
test1 <- 1
# 1test <- 2 # wrong, would result in error
`1test` <- 2 # this would be possible
test_1 <- 5
test.1 <- 2
`test-1` <- 6
`test(1)` <- 5
Test <- "bla"
HereAreFilteredData <- "" #CamelCase
here_are_filtered_data <- "test" #snake_case
`Weight [kg]` <- 67
```

2.3.2 Basic classes of data

`R` is ‘guessing’ the suitable type of data from input. This should be checked after e.g. importing data! If elements of different classes are found, the more inclusive is used. There are functions to change / force a type if needed.

The `class()` function returns the class of an object, which determines how it behaves with respect to functions like `print()`. The class of an object can be changed by using generic functions and methods.

The `typeof()` function returns the basic data type of an object, which determines how it is stored in memory. The basic data type of an object cannot be changed.

The `str()` function shows class and examples of an object.

2.3.2.1 Guessed classes

```
float_num <- 123.456  
class(float_num)
```

```
[1] "numeric"
```

```
typeof(float_num)
```

```
[1] "double"
```

```
str(float_num)
```

```
num 123
```

```
int_num <- 123L # L specifies integer, guessing requires more values  
class(int_num)
```

```
[1] "integer"
```

```
typeof(int_num)
```

```
[1] "integer"
```

```
integer(length = 3)
```

```
[1] 0 0 0
```

```
result<-9^(1/2)  
result
```

```
[1] 3
```

```
print(result)
```

```
[1] 3
```

```
cat(result)
```

```
3
```

```
char_var <- "some words"  
class(char_var)
```

```
[1] "character"
```

```
typeof(char_var)
```

```
[1] "character"
```

```
character(length = 5)
```

```
[1] "" "" "" "" "
```

```
logical_var <- TRUE # can be abbreviated to T  
logical_var2 <- FALSE # or F, seen as bad style  
class(logical_var)
```

```
[1] "logical"
```

```
typeof(logical_var)
```

```
[1] "logical"
```

```
logical(length = 3)
```

```
[1] FALSE FALSE FALSE
```

```
# logicals usually are defined by conditions:  
int_num < float_num
```

```
[1] TRUE
```

```
# all numbers are true but 0  
as.logical(c(0,1,5,-7.45678)) # c() combines values into a vector
```

```
[1] FALSE TRUE TRUE TRUE
```

*Factor: categorical variables with limited set of distinct values, internally stored as integers.
Everything intended to group subjects or representing categories should be stored as factor.
Package forcats provides nice tools for factors!*

```
factor_var <- factor(c("m","m","f","m","f","f","?"))  
factor_var
```

```
[1] m m f m f f ?  
Levels: ? f m
```

```
class(factor_var)
```

```
[1] "factor"
```

```
typeof(factor_var) # that is why factors can be called enumerated type
```

```
[1] "integer"
```

```
# factor definition can reorder, rename, and drop levels:  
factor_var2 <- factor(c("m","m","f","m","f","f","?"),  
                        levels=c("m","f"),  
                        labels=c("male","female"))  
factor_var2
```

```
[1] male male female male female female <NA>  
Levels: male female
```

Dates / Time:

```
(date_var <- Sys.Date())
```

```
[1] "2024-07-11"
```

```
class(date_var)
```

```
[1] "Date"
```

```
typeof(date_var)
```

```
[1] "double"
```

```
class(Sys.time())
```

```
[1] "POSIXct" "POSIXt"
```

Mixed classes:

```
test2 <- c(1,2,"a","b")
class(test2)
```

```
[1] "character"
```

```
test2
```

```
[1] "1" "2" "a" "b"
```

2.3.2.2 *Forcing / casting classes*

Casting functions usually start with `as.` , when creating variables filled with NA, use casting functions or specific variants of NA to force type!

```
(test <- c(1,2,3,"a","b","c"))
```

```
[1] "1" "2" "3" "a" "b" "c"
```

```
(test_n <- as.numeric(test))
```

Warning: NAs introduced by coercion

```
[1] 1 2 3 NA NA NA
```

```
as.numeric(factor_var)
```

```
[1] 3 3 2 3 2 2 1
```

```
as.character(10:19)
```

```
[1] "10" "11" "12" "13" "14" "15" "16" "17" "18" "19"
```

```
# NAs  
(test_NA1 <- rep(NA,10))
```

```
[1] NA NA NA NA NA NA NA NA NA NA
```

```
class((test_NA1))
```

```
[1] "logical"
```

```
class(NA_real_)
```

```
[1] "numeric"
```

```
(test_NA2 <- rep(NA_real_,10))
```

```
[1] NA NA NA NA NA NA NA NA NA NA
```

```
class((test_NA2))
```

```
[1] "numeric"
```

```
class(NA_integer_)

[1] "integer"

class(NA_character_)

[1] "character"

class(NA_Date_) # from package lubridate

[1] "Date"

# test_NA_factor <-
#   factor(rep(NA,10),
#         levels=c("WT","Mutation1", "Mutation2"))
# class(test_NA_factor)
```

2.3.3 Indexing variables

The most general kind of indexing is by position, starting with 1. Negative numbers result in exclusion of position(s). Position indices are provided within square brackets. The index can (and usually will) be a variable instead of hard coded numbers.

```
(numbers1 <- c(5,3,6,8,2,1))

[1] 5 3 6 8 2 1

numbers1[1]

[1] 5

numbers1[1:3]

[1] 5 3 6
```

```
numbers1[-c(1,3)]
```

```
[1] 3 8 2 1
```

```
numbers2 <- 1:3  
numbers1[numbers2]
```

```
[1] 5 3 6
```

```
# numbers1[1,2] #Error: incorrect number of dimensions
```

To get first or last entries, `head()` and `tail()` can be used. By default 6 entries are returned.

```
tail(x=numbers1, n = 1)
```

```
[1] 1
```

```
head(x = numbers1, n = 3)
```

```
[1] 5 3 6
```

```
nth(x = numbers1, n=-2) # 2nd to last
```

```
[1] 2
```

2.3.4 Usage of variables

Variables are like placeholders for their content, so that you don't have to remember where you left things. Operations on variables are operations on their content. Changing the content of a variable does not automatically save those changes back to the variable, this needs to be done explicitly!

```
numbers1 + 100 # not stored anywhere, just printed
```

```
[1] 105 103 106 108 102 101
```

```
numbers1 + numbers2 # why does this even work?
```

```
[1] 6 5 9 9 4 4
```

When combining variables of different length, the short one is recycled, so the numbers2 is added to the first 3 elements of numbers2, then is reused and added to the remaining 3 elements. If the length of the longer is not a multiple of the shorter, there will be a warning.

```
c(2,4,6,8) + 1
```

```
[1] 3 5 7 9
```

```
c(2,4,6,8) + c(1,2)
```

```
[1] 3 6 7 10
```

```
c(2,4,6,8) + c(1,2,3)
```

Warning in c(2, 4, 6, 8) + c(1, 2, 3): longer object length is not a multiple of shorter object length

```
[1] 3 6 9 9
```

2.4 Functions

2.4.1 Function usage

Functions have the same naming rules as variables, but the name is always followed by opening/closing round brackets, within those brackets function parameters/arguments can be specified to provide input or control behavior:

FunctionName(parameter1=x1,parameter2=x2,x3,...)

Most functions have named arguments, those argument names may be omitted as long as parameter values are supplied in the defined order. Arguments may have predefined default values, see *help!* Some functions like *c()* use unnamed arguments.

```
c("my", "name") # unnamed
```

```
[1] "my"    "name"
```

```
# ?mean  
mean(x = c(3,5,7,NA)) #using default parameters
```

```
[1] NA
```

```
mean(x = c(3,5,7,NA),na.rm = TRUE) #overriding default parameter
```

```
[1] 5
```

```
mean(na.rm = TRUE, x=c(3,5,7,NA)) # changed order of arguments
```

```
[1] 5
```

```
mean(c(3,5,7,NA), na.rm = TRUE) # name of 1st argument omitted
```

```
[1] 5
```

```
sd(c(3,5,7,NA), na.rm = TRUE)
```

```
[1] 2
```

```
# same logic as mean, partially the same arguments  
median(1:100, TRUE)
```

```
[1] 50.5
```

```
# omitting arguments influences readability of a function, careful!  
t <- c(1:10,100)  
quantile(x = t,probs = c(.2,.8))
```

```
20% 80%  
3     9
```

```
# putting text elements together  
paste("some text", 1:3)
```

```
[1] "some text 1" "some text 2" "some text 3"
```

```
paste0("some text", 1:3)
```

```
[1] "some text1" "some text2" "some text3"
```

```
paste("some text", 1:3, sep = ": ")
```

```
[1] "some text: 1" "some text: 2" "some text: 3"
```

```
paste("some text", 1:3,sep = ": ", collapse = "; ")
```

```
[1] "some text: 1; some text: 2; some text: 3"
```

```
paste("some text", 1:3,sep = ": ", collapse = "\n") |> cat()
```

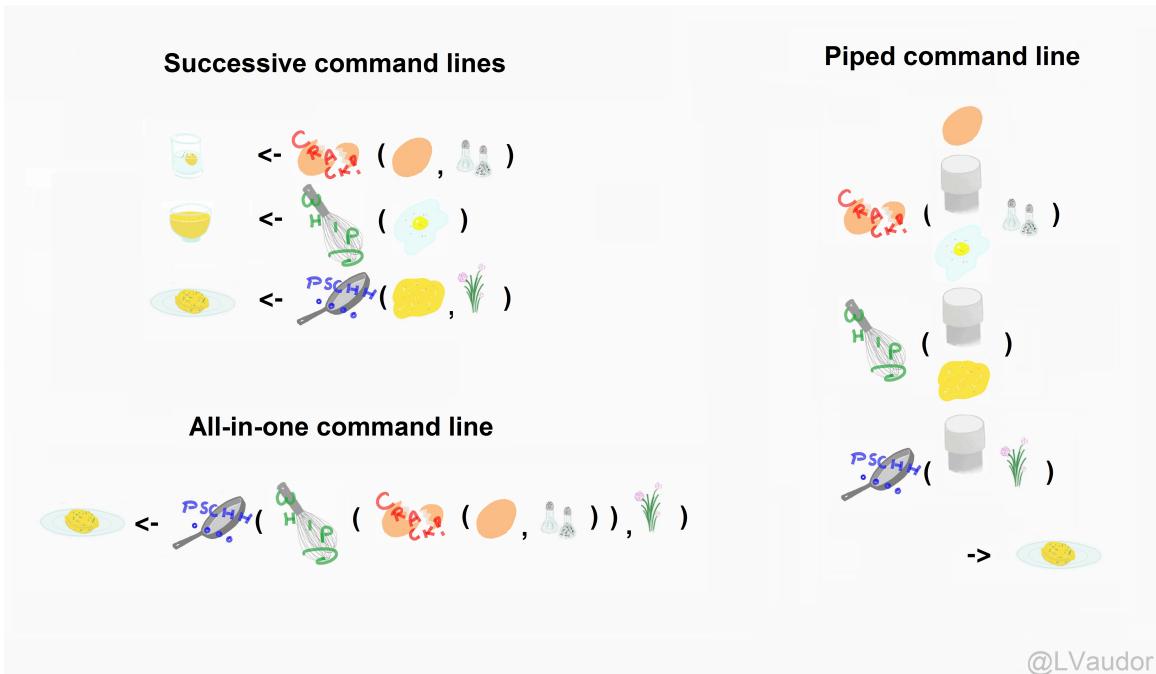

```
some text: 1  
some text: 2  
some text: 3
```

```
paste("mean", "SD", sep = " \u00b1 ")
```

```
[1] "mean ± SD"
```

2.4.2 Functions combined

Functions often just solve one problem or task, so usually we need to combine them. This can be done by nesting or piping. Piping makes reading/understanding scripts easier, as it shows order of functions:

@LVaudor

Figure 2.1: Piping functions

```
# functions may be nested:
floor(
  as.numeric(
    Sys.Date() -
      as.Date("1985/12/10"))/
  365.25)
```

[1] 38

```
# or (usually better) piped:
mtcars |> # inbuild example data, use F1!
  mutate(am=factor(am,
    levels=c(0,1),
    labels=c("automatic",
      "manual")))) |> #change into better class
  filter(vs==1) |> #filter out V-shaped
  group_by(am) |> # ask for grouped analysis
  summarize(across(.cols = c(wt, mpg, qsec, disp),
    .fns = meansd)) |>
  pivot_longer(cols = -am, names_to = "Measure") |> # put variables in rows
  pivot_wider(id_cols = Measure, names_from = am, #put groups in cols
    values_from = value)
```

```
# A tibble: 4 x 3
  Measure automatic manual
  <chr>    <chr>     <chr>
1 wt       3.2 ± 0.3 2.0 ± 0.4
2 mpg      21 ± 2    28 ± 5
3 qsec     20 ± 1    19 ± 1
4 disp     175 ± 49   90 ± 19
```

If a sequence of functions is used often, combining them into a new function is advisable, e.g. this combination of descriptive and test statistics:

```
# can be combined into higher order functions:
compare2numvars(data = mtcars,
                  dep_vars = c("mpg", "wt", "qsec"),
                  indep_var = "am",
                  add_n = TRUE,
                  gaussian = TRUE)
```

```
# A tibble: 3 x 5
  Variable desc_all          `am 0`          `am 1`          p
  <fct>    <chr>            <chr>            <chr>            <chr>
1 mpg       20 ± 6 [n=32]    17 ± 4 [n=19]    24 ± 6 [n=13]  0.001
2 wt        3.2 ± 1.0 [n=32] 3.8 ± 0.8 [n=19]  2.4 ± 0.6 [n=13] 0.001
3 qsec      18 ± 2 [n=32]   18 ± 2 [n=19]   17 ± 2 [n=13]  0.206
```

2.4.3 Writing functions

```
#FunctionName<-function(parameters...){definition}
division <- function(x, y){
  return(x/y)
}
(Sys.Date()-as.Date("1958/12/10")) |>
  as.numeric() |>
  division(y = 365.25, x=_) |>
  floor()
```

```
[1] 65
```

```
Mymean<-function(values)
{
  return(base::mean(values, na.rm=TRUE))
}
```

```

mark_sign<-function(SignIn) {
  SignIn <- as.numeric(SignIn)
  if(is.na(SignIn)){
    SignOut<-"wrong input, stupido!"
  } else {
    # if (!is.na(SignIn)) {
    SignOut<-"n.s."
    if(SignIn<=0.1) {SignOut<-"+"}
    if(SignIn<=0.05) {SignOut<-"*"}
    if(SignIn<=0.01) {SignOut<-"**"}
    if(SignIn<=0.001) {SignOut<-"***"}
    }
    return(SignOut)
  }
}

mark_sign(SignIn=0.035)

```

[1] "*"

```
mark_sign(SignIn="0.35")
```

[1] "n.s."

```
mark_sign(SignIn = "p=3,5%")  #wrong input
```

Warning in mark_sign(SignIn = "p=3,5%"): NAs introduced by coercion

[1] "wrong input, stupido!"

different implementation

```

markSign0 <- function(SignIn, plabel = c("n.s.", "+", "*", "**", "***")) {
  SignIn <- suppressWarnings(
    as.numeric(SignIn))
  SignOut <- cut(SignIn,
                  breaks = c(-Inf, .001, .01, .05, .1, 1),
                  labels = rev(plabel))
}
return(SignOut)

```

```
}
```

```
markSign0(SignIn=c(0.035, 0.00002, .234))
```

```
[1] *      ***  n.s.  
Levels: *** ** * + n.s.
```

```
markSign0(SignIn="0.35")
```

```
[1] n.s.  
Levels: *** ** * + n.s.
```

```
markSign0(SignIn = "p=3,5%")    #wrong input
```

```
[1] <NA>  
Levels: *** ** * + n.s.
```

```
#source("F:/Aktenschrank/Analysen/R/myfunctions.R")
```

2.5 More complex data types, created by functions

2.5.1 Matrix

A matrix is a 2-dimensional data structure, where all elements are of the same class.

2.5.1.1 Creation

```
my1.Matrix<-  
  matrix(data=1:12,  
         # nrow=4, # this is not needed, can be derived from data  
         ncol=3,  
         byrow=TRUE, # date are put into row 1 first  
         dimnames=list(paste0("row", 1:4),  
                       paste0("col", 1:3)))  
print(my1.Matrix)
```

```

    col1 col2 col3
row1    1    2    3
row2    4    5    6
row3    7    8    9
row4   10   11   12

```

```

data <- seq(from = 1, to = 100, by = 1) #1:100
nrow <- 10
matrix(data=data,
       nrow=nrow,
       byrow=FALSE, # data are put into column 1 first
       dimnames=list(paste0("row",1:nrow),
                     paste0("col",1:(length(data)/nrow)))) |>
head()

```

```

    col1 col2 col3 col4 col5 col6 col7 col8 col9 col10
row1    1   11   21   31   41   51   61   71   81   91
row2    2   12   22   32   42   52   62   72   82   92
row3    3   13   23   33   43   53   63   73   83   93
row4    4   14   24   34   44   54   64   74   84   94
row5    5   15   25   35   45   55   65   75   85   95
row6    6   16   26   36   46   56   66   76   86   96

```

```

my2.Matrix <- matrix(c(1,2,3, 11,12,13),
                      nrow = 2, ncol=3) #byrow=FALSE, specified but default
my2.Matrix

```

```

[,1] [,2] [,3]
[1,]    1    3   12
[2,]    2   11   13

```

2.5.1.2 Indexing

Addressing a matrix is done with [row_index, column_index]

```
my1.Matrix[2, 3] # Index:[row,column]
```

```
[1] 6
```

```
my1.Matrix[2,] # all columns
```

```
col1 col2 col3  
4      5      6
```

```
my1.Matrix[, 2] # all rows
```

```
row1 row2 row3 row4  
2      5      8      11
```

```
my1.Matrix[c(1, 3), -2] # exclude column 2
```

```
col1 col3  
row1    1    3  
row3    7    9
```

```
my1.Matrix[1,1] <- NA # Index can be used for writing as well
```

2.5.2 Data frame

A data frame has 2 dimensions, it can handle various data types (1 per columns). This structure is rather superseded by tibbles (see below).

2.5.2.1 Creation

Data frames are defined by creating and filling columns, functions can be used (and piped) to create content.

```
patientN<-15  
(myTable<-data.frame(  
  patientCode=paste0("pat",1:patientN),  
  Var1 = 1, # gets recycled  
  Var2 = NA_Date_)) |> head()
```

```
patientCode Var1 Var2  
1          pat1    1 <NA>  
2          pat2    1 <NA>  
3          pat3    1 <NA>  
4          pat4    1 <NA>  
5          pat5    1 <NA>  
6          pat6    1 <NA>
```

```
str(myTable)
```

```
'data.frame': 15 obs. of 3 variables:  
$ patientCode: chr "pat1" "pat2" "pat3" "pat4" ...  
$ Var1       : num 1 1 1 1 1 1 1 1 1 1 ...  
$ Var2       : Date, format: NA NA ...
```

```
set.seed(101)  
myTable<-data.frame(  
  patientCode=paste0("pat",1:patientN),  
  Age=runif(n=patientN,min=18,max=65) |> floor(),  
  Sex=factor(rep(x=NA,times=patientN),  
             levels=c("m","f")),  
  `sysRR (mmHg)`=round(rnorm(n=patientN,mean=140,sd=10)),  
  check.names = FALSE)  
head(myTable)
```

	patientCode	Age	Sex	sysRR (mmHg)
1	pat1	35	<NA>	142
2	pat2	20	<NA>	132
3	pat3	51	<NA>	122
4	pat4	48	<NA>	157
5	pat5	29	<NA>	144
6	pat6	32	<NA>	148

2.5.2.2 Indexing

Beside the numeric index, columns can be addressed by name. This can be done by either `dfname$colname` (for the content of a single column) or `dfname[, "colname"]` for 1 or more columns.

```
myTable[1:5,1]
```

```
[1] "pat1" "pat2" "pat3" "pat4" "pat5"
```

```
myTable$patientCode[1:5]
```

```
[1] "pat1" "pat2" "pat3" "pat4" "pat5"
```

```
myTable[1:5,"patientCode"]
```

```
[1] "pat1" "pat2" "pat3" "pat4" "pat5"
```

```
# returns vector of values for a single column, data.frame otherwise  
myTable["patientCode"] # returns df
```

```
patientCode  
1      pat1  
2      pat2  
3      pat3  
4      pat4  
5      pat5  
6      pat6  
7      pat7  
8      pat8  
9      pat9  
10     pat10  
11     pat11  
12     pat12  
13     pat13  
14     pat14  
15     pat15
```

```
columns<-c("Sex", "Age")  
myTable[1:5, columns]
```

```
Sex Age  
1 <NA> 35  
2 <NA> 20  
3 <NA> 51  
4 <NA> 48  
5 <NA> 29
```

```
myTable[1:5, c("patientCode", "Age")]
```

```
patientCode Age  
1      pat1 35  
2      pat2 20  
3      pat3 51  
4      pat4 48  
5      pat5 29
```

```
myTable[,1] <- paste0("Code", 1:patientN)
```

2.5.3 Tibble

Tibbles are a modern and efficient data structure that extends data frames, providing enhanced features and performance for data manipulation and analysis.

2.5.3.1 Creation

```
patientN <- 25
rawdata <- tibble(
  PatID=paste("P",1:patientN), # as in data.frame
  Sex=sample(x = c("male","female"), # random generator
             size = patientN,replace = TRUE,
             prob = c(.7,.3)),
  Ethnicity=sample(x = 1:6,
                   size = patientN,
                   replace = TRUE,
                   prob = c(.01,.01,.05,.03,.75,.15)),
  # random assignments
  `Given name`=randomNames(n = patientN,
                            gender = Sex,
                            # this is a reference to column Sex
                            ethnicity = Ethnicity,
                            which.names = "first"),
  `Family name`=randomNames(n = patientN,
                            ethnicity = Ethnicity,
                            which.names = "last"),
  Treatment=sample(x = c("Placebo","Verum"),
                    size = patientN,
                    replace = TRUE),
  `sysRR (mmHg)`=round(rnorm(n=patientN,mean=140,sd=10))-
    (Treatment=="Verum")*15,
  `diaRR (mmHg)`=round(rnorm(n=patientN,mean=80,sd=10))-
    (Treatment=="Verum")*10,
  HR=round(rnorm(n=patientN,mean=90,sd=7)))
rawdata
```

```
# A tibble: 25 x 9
  PatID Sex   Ethnicity `Given name` `Family name` Treatment `sysRR (mmHg)` `diaRR (mmHg)`
  <chr> <chr>     <int> <chr>       <chr>       <chr>           <dbl>
1 P 1   male        5 Ian         Roy      Placebo        128
```

```

2 P 2   male      3 Dametrious    Martin      Placebo      116
3 P 3   female    5 Alyxandra     Fisher      Verum       120
4 P 4   female    6 Musfira      el-Karimi    Verum       130
5 P 5   male      6 Saleel       al-Bey      Placebo      135
6 P 6   male      5 Kahner       Melott      Verum       148
7 P 7   male      5 Skylar       Burgess     Verum       137
8 P 8   male      5 Michael      Harper      Placebo      139
9 P 9   female    5 Julia        Tovrea     Placebo      154
10 P 10  male     4 Eric         Barreras    Verum       113
# i 15 more rows
# i 2 more variables: `diaRR (mmHg)` <dbl>, HR <dbl>

```

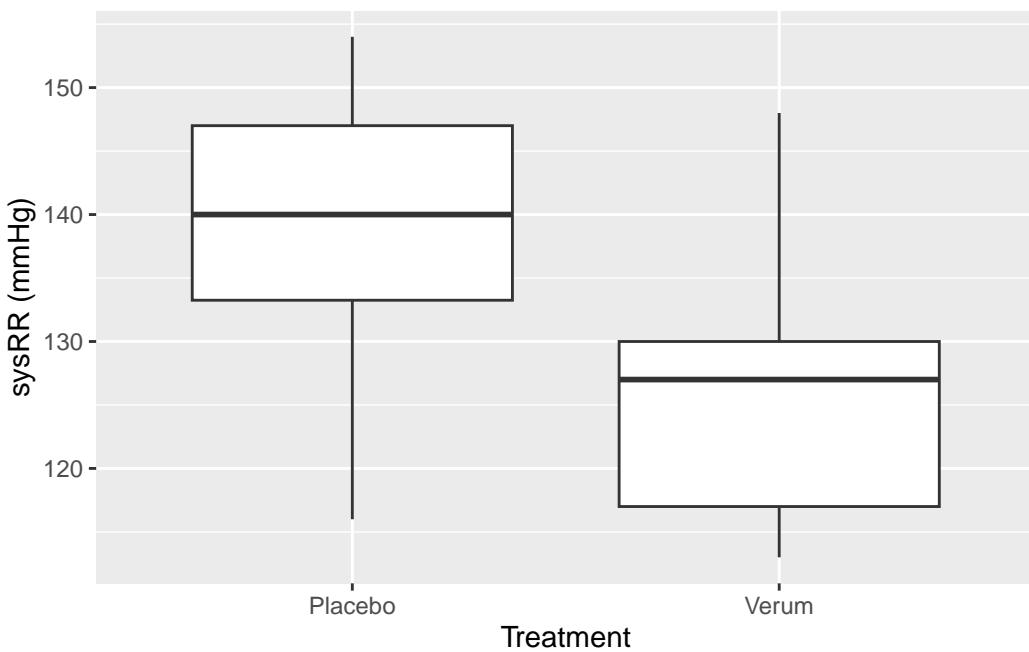

```
colnames(rawdata)
```

```
[1] "PatID"          "Sex"           "Ethnicity"      "Given name"    "Family name"
[6] "Treatment"     "sysRR (mmHg)"  "diaRR (mmHg)"  "HR"
```

```
cn() # shortcut from wrappedtools
```

```
[1] "PatID"          "Sex"           "Ethnicity"      "Given name"    "Family name"
[6] "Treatment"     "sysRR (mmHg)"  "diaRR (mmHg)"  "HR"
```

```
# example of data management for a tibble, recoding ethnicity:
rawdata <- rawdata |>
  mutate(Ethnicity=factor(
    Ethnicity, levels = 1:6,
    labels= c(
      "American Indian or Native Alaskan",
      "Asian or Pacific Islander",
      "Black (not Hispanic)",
      "Hispanic",
      "White (not Hispanic)",
      "Middle-Eastern, Arabic")))
# quick visual inspection
ggplot(rawdata,aes(x = Treatment,y = `sysRR (mmHg)`))+
  geom_boxplot()
```

2.5.3.2 Indexing

The same rules as for the data frame, but more consistent behavior.

```
rawdata[1:5,1:2]
```

```
# A tibble: 5 x 2
  PatID Sex
  <chr> <chr>
1 P 1   male
2 P 2   male
3 P 3   female
4 P 4   female
5 P 5   male
```

```
rawdata[,6]
```

```
# A tibble: 25 x 1
  Treatment
  <chr>
1 Placebo
2 Placebo
3 Verum
```

```
4 Verum
5 Placebo
6 Verum
7 Verum
8 Placebo
9 Placebo
10 Verum
# i 15 more rows
```

```
rawdata[6]
```

```
# A tibble: 25 x 1
  Treatment
  <chr>
1 Placebo
2 Placebo
3 Verum
4 Verum
5 Placebo
6 Verum
7 Verum
8 Placebo
9 Placebo
10 Verum
# i 15 more rows
```

```
rawdata[[6]]
```

```
[1] "Placebo" "Placebo" "Verum"    "Verum"    "Placebo" "Verum"    "Verum"
[8] "Placebo" "Placebo" "Verum"    "Verum"    "Verum"   "Verum"    "Placebo"
[15] "Verum"   "Verum"   "Verum"    "Placebo"  "Placebo"  "Verum"    "Placebo"
[22] "Placebo" "Placebo" "Placebo"  "Verum"
```

```
rawdata$`Family name`
```

```
[1] "Roy"          "Martin"        "Fisher"        "el-Karimi"
[5] "al-Bey"       "Melott"        "Burgess"       "Harper"
[9] "Tovrea"      "Barreras"     "Klamerus"     "al-Satter"
[13] "al-Sultana"  "Yi"            "Helm"          "Molina-Peinado"
[17] "Spilsted"    "Egan"          "Thompson"     "Schauss"
[21] "Owens"        "Vick"          "Reeves"        "Chesney"
[25] "Minnillo"
```

Differences in addressing data frames and tibbles:

- *tibble and [always returns tibble*
- *tibble and [[always returns vector*
- *data.frame and [may return data.frame (if >1 column) or vector*
- *data.frame and [[always returns vector*

```
rawdata_df <- as.data.frame(rawdata)
rawdata[2] #returns Tibble with 1 column
```

```
# A tibble: 25 x 1

```
rawdata |> select(`sysRR (mmHg)`)
```

```

# A tibble: 25 x 1
`sysRR (mmHg)`
<dbl>
1      128
2      116
3      120
4      130
5      135
6      148
7      137
8      139
9      154
10     113
# i 15 more rows

```

```
rawdata |> select(contains("r"), -contains("rr"))
```

```

# A tibble: 25 x 2
Treatment    HR
<chr>      <dbl>
1 Placebo     88
2 Placebo     82
3 Verum       93
4 Verum       82
5 Placebo    100
6 Verum       85
7 Verum       98
8 Placebo     94
9 Placebo     83
10 Verum      82
# i 15 more rows

```

```
rawdata |> pull(`sysRR (mmHg)`)
```

```
[1] 128 116 120 130 135 148 137 139 154 113 118 117 117 127 143 117 135 117 147 127  
[20] 130 136 141 150 147 130
```

Exercise: Think of a cruet_stand / Gewürzmenage

- define `n_elements <- 5*10^3`
- create a tibble “menage” with columns `saltshaker`, `peppercaster` and `n_elements` each for `saltgrain` and `pepperflake`
- print `saltshaker`
- print `salt`
- print 100 `saltgrains`

2.5.4 List

While `matrix`, `data.frames`, and `tibbles` always have the same number of rows for each column, sometimes different lengths are required. A list can handle all kinds of data with different number of elements for each sublist. This is a typical output format for statistical functions and is useful for collecting e.g. result tables or figures. Package `rlist` provides useful tools.

2.5.4.1 Creation

```
shopping<-list(beverages=c("beer","water",
                             "gin(not Gordons!!)","tonic"),
                 snacks=c("chips","pretzels"),
                 nonfood=c("DVDs","Akku"),
                 mengen=1:10,
                 volumen=rnorm(50,100,2))
shopping
```

```
$beverages
[1] "beer"           "water"          "gin(not Gordons!!)"
[4] "tonic"

$snacks

2.6 Control structures

2.6.1 Loops

Repetitive tasks like computation of descriptive statistics over many variables or repeated simulations of data can be declared inside of a loop. There are functions (like `summarize(across(...))`) that create those repetitions internally, but often doing this explicitly improves readability or helps solving various tasks like describing AND plotting data.

2.6.1.1 *for-loop*

In a *for-loop*, we can define the number of runs in advance, e.g. by the number of variables to describe. There are 2 ways/styles, how to define this number:

1. by creating an index variable with an integer vector 1,2,3, ... number of runs/variables
2. by creating an index containing e.g. colnames

```
# integer index
print("### Game of Loops ###")
```

```
[1] "### Game of Loops ###"
```

```
for(season_i in 1:3) {
  cat(paste("GoL Season",season_i,"\n"))
  for(episode_i in 1:5) {
    cat(paste0("  GoL S.",season_i,
               " Episode ",episode_i,"\n"))
  }
  cat("\n")
}
```

```
GoL Season 1
GoL S.1 Episode 1
GoL S.1 Episode 2
GoL S.1 Episode 3
GoL S.1 Episode 4
GoL S.1 Episode 5
```

```
GoL Season 2
GoL S.2 Episode 1
GoL S.2 Episode 2
GoL S.2 Episode 3
GoL S.2 Episode 4
GoL S.2 Episode 5
```

```
GoL Season 3
GoL S.3 Episode 1
GoL S.3 Episode 2
GoL S.3 Episode 3
GoL S.3 Episode 4
GoL S.3 Episode 5
```

```

# content index
## names of elements
for(col_i in colnames(rawdata)){
  print(col_i)
}

```

```

[1] "PatID"
[1] "Sex"
[1] "Ethnicity"
[1] "Given name"
[1] "Family name"
[1] "Treatment"
[1] "sysRR (mmHg)"
[1] "diaRR (mmHg)"
[1] "HR"

```

```

## content of elements
for(col_i in shopping){
  print(col_i)
}

```

```

[1] "beer"           "water"          "gin(not Gordons!!)"
[4] "tonic"

[43] 101.56033 98.08456 100.80067 101.36969 94.41230 100.80553 99.60254
[50] 100.62478

```

```

# automatic creation of integer index from elements
#for(col_i in 1:ncol(rawdata)){
  for(col_i in seq_along(colnames(rawdata))){
    print(colnames(rawdata)[col_i])
  }
}

```

```

[1] "PatID"

```

```
[1] "Sex"  
[1] "Ethnicity"  
[1] "Given name"  
[1] "Family name"  
[1] "Treatment"  
[1] "sysRR (mmHg)"  
[1] "diaRR (mmHg)"  
[1] "HR"
```

```
# edge-case of 0 elements -> 0 runs  
for(col_i in seq_len(0)){  
  print(colnames(rawdata)[col_i])  
}
```

2.6.1.2 *while-loops*

If not number of repetitions is know, but a condition.

```
test <- 0  
while(test<10){  
  print(test)  
  test <- test + 1  
}
```

```
[1] 0  
[1] 1  
[1] 2  
[1] 3  
[1] 4  
[1] 5  
[1] 6  
[1] 7  
[1] 8  
[1] 9
```

2.6.2 *Conditions*

2.6.2.1 *if else*

We can run code if condition(s) are true:

```
sex<-"female"
if(sex=="male") {
  print("Male")
} else {
  print("Female")
}
```

```
[1] "Female"
```

```
if(sex=="male") {
  print("Male")
}

if(sex!="male"){
  print("Female")
}
```

```
[1] "Female"
```

```
testvar <- 4
if(testvar %in% c(1,3,5)){
  print("uneven")
} else {
  print("probably even")
}
```

```
[1] "probably even"
```

```
TRUE & FALSE # AND
```

```
[1] FALSE
```

```
all(TRUE, FALSE)
```

```
[1] FALSE
```

```
(1<10) & (sex=="male")
```

```
[1] FALSE
```

```
all(1<10,sex=="male")
```

```
[1] FALSE
```

```
TRUE | FALSE # OR
```

```
[1] TRUE
```

```
any(TRUE, FALSE)
```

```
[1] TRUE
```

```
(1>10) | (1<5)
```

```
[1] TRUE
```

```
age <- 5  
(sex=="female" & age<=12) | (sex=="male" & age <= 14)
```

```
[1] TRUE
```

```
any(all(sex=="female",age<=12),  
    all(sex=="male", age <= 14))
```

```
[1] TRUE
```

2.6.2.2 *ifelse*

We can get text conditionally:

```
print(ifelse(test = sex=="male",  
            yes = "is male",  
            no = "is female"))
```

```
[1] "is female"
```

```

p <- .12
paste0("That is ",
       ifelse(test = p<=.05, yes = "", no = "not "),
       "significant")

```

```
[1] "That is not significant"
```

```

if(p>.05){
  sign_out <- "not "
} else {
  sign_out <- ""
}
paste0("That is ",
       sign_out,
       "significant")

```

```
[1] "That is not significant"
```

2.6.2.3 `case_when` / `case_match`

When there are many tests to do, `case_when` or `case_match` are nice replacements for `ifelse`. While `case_when` allows complex conditions, `case_match` is used for for simple comparisons:

```

rawdata <- mutate(.data = rawdata,
  Hypertension=case_when(
    `sysRR (mmHg)`<120 & `diaRR (mmHg)`<70 ~ "normotensive",
    `sysRR (mmHg)`<160 & `diaRR (mmHg)`<=80 ~ "borderline",
    .default = "hypertensive"),
  `prescribe something?` = case_match(
    Hypertension,
    "hypertensive" ~ "yes",
    "borderline" ~ "possibly",
    "normotensive" ~ "no"))
rawdata |>
  select(contains("RR"),Hypertension, contains("pres"))

```

```

# A tibble: 25 x 4
`sysRR (mmHg)` `diaRR (mmHg)` Hypertension `prescribe something?` 
<dbl>          <dbl> <chr>           <chr>
1            128             87 hypertensive yes

```

```
2      116      72 borderline  possibly
3      120      60 borderline  possibly
4      130      76 borderline  possibly
5      135      60 borderline  possibly
6      148      85 hypertensive yes
7      137      54 borderline  possibly
8      139      95 hypertensive yes
9      154      71 borderline  possibly
10     113      74 borderline  possibly
# i 15 more rows
```

3 Regular expressions

3.1 Intro

Regex cheatsheet

Regular expressions are a *powerful* tool for searching and manipulating text data. They allow you to define specific patterns within sequences, which is particularly useful when analyzing biological data such as DNA or protein sequences. But more mundane, they are terribly useful for practical tasks like finding or renaming variables, correcting common typos, and checking input patterns.

Basic functions like `grep()` or `gsub()` are difficult to use in pipelines and not very intuitive, tidyverse functions from `stringr` like `str_detect()` or `str_replace()` are more verbose and easier to use.

Key symbols and their meanings:

- `.` (period): Matches any single character except a newline. For example, “A.T” would match “AAT”, “AGT”, “ACT”, etc.
- `[]` (square brackets): Defines a character class. Any character within the brackets will match. For example, “[ATGC]” matches any DNA nucleotide.
- `{}` (curly braces): Specify the number of occurrences of the preceding element. For example, “A{3}” matches exactly three consecutive “A”s, like in “AAA”.
- `\d`: Matches any digit (0-9). For example, “\d+” matches one or more digits, which could be useful for finding numerical identifiers in protein databases.
- `\D`: Matches any non-digit character.

An example for their use in renaming variables:

```
pacman::p_load(tidyverse)
temptibble <- tibble(
  cup_weigh=seq(10,20,.5),
  CAPSIZE_cm=5,
  height_of_cup_cm=rnorm(21,10,.01))
colnames(temptibble)
```

```
[1] "cup_weigh"           "CAPSIZE_cm"          "height_of_cup_cm"
```

```

rename_with(
  .data = temptibble,
  .fn = ~str_replace_all(.x,
    c("CAP"="CUP",
      "_(cm)"=" (\\\1)",
      "(.*)_of_(.+)( .*)"="\\\2\\\1\\\3",
      "_"=""))
  str_to_sentence()) |>
  colnames()

```

```
[1] "Cupweigh"          "Cupsize (cm)"     "Cupheight (cm)"
```

3.2 Exercise

```

testset1 <- c("Meier","Mayer","Maier","Meyer","Mayr","Maya","Mayor")
# find all variations of the name "Meier"

testset2 <- c("weight_mm","height_cm","age_yr","temp_c")
#replace _ with space
#replace _ with space and add unit in brackets

testset3 <- c("1980_12_30","13.04.2005", "2005/04/25","24121990")
# transform into YYYY-MM-DD

testset4 <- c("pw2000","That1sb3tt3r","M@kesSense?","NoDigits@this1")
# test pwd strength, rules: Upper, lower, special char, number, min 8 char long

```

4 Importing data

```
pacman::p_load(conflicted,tidyverse, wrappedtools,  
                readxl, readODS, foreign, haven)
```

4.1 Import from text files (.txt, .csv)

There are base functions like `read.csv()` and tidyverse-based updated ones like `read_csv()`. Different versions like `read_csv2()` or `read_delim()` have different settings for delimiters, number formats etc.

```
rawdata <- read_csv2("data/Medtest_e.csv")
```

i Using `'',''` as decimal and `'..'` as grouping mark. Use ``read_delim()`` for more control.

```
Rows: 28 Columns: 25  
-- Column specification -----  
Delimiter: ";"  
chr (1): sex  
dbl (24): randomcode, included, finalized, testmedication, size, weight, sys...
```

i Use ``spec()`` to retrieve the full column specification for this data.
i Specify the column types or set ``show_col_types = FALSE`` to quiet this message.

4.2 Import from Excel

4.2.1 Tidy Excel files

```
rawdata <- read_excel(path = "data/Medtest_e.xlsx") |>  
  rename_with(.fn = ~str_replace_all(.x,pattern="_",replacement=" ")) |>  
  rename_with(.fn=str_to_title,  
             .cols = !contains(c("BP","BMI","NY"))) |>  
  rename(`Size (cm)`=Size, #newname=oldname  
        `Weight (kg)`=Weight) |>
```

```
select(-`Sex M`)
saveRDS(rawdata,file = "data/rawdata.rds")
```

4.2.2 ODS files

Package readODS provides similar functionality for OpenOffice/LibreOffice files.

4.2.3 Excel file with units row

1. Import names section and data section separately
2. Loop over all columns
 1. test for existence of unit, if not NA
 2. paste 1st row, "[, 2nd row,]"
3. Use 1st row as colnames for data

```
cn_temp <- read_excel(path = "data/Medtest_e.xlsx",
                      range = "A1:Y2", col_names = FALSE,
                      sheet = 2)
```

```
New names:
* `` -> `...1`
* `` -> `...2`
* `` -> `...3`
* `` -> `...4`
* `` -> `...5`
* `` -> `...6`
* `` -> `...7`
* `` -> `...8`
* `` -> `...9`
* `` -> `...10`
* `` -> `...11`
* `` -> `...12`
* `` -> `...13`
* `` -> `...14`
* `` -> `...15`
* `` -> `...16`
* `` -> `...17`
* `` -> `...18`
* `` -> `...19`
* `` -> `...20`
```

```

* `` -> `...21`
* `` -> `...22`
* `` -> `...23`
* `` -> `...24`
* `` -> `...25`

for(col_i in colnames(cn_temp)){
  if(!is.na(cn_temp |> slice(2) |> pull(col_i))){
    cn_temp[1,col_i] <-
      paste0(cn_temp[1,col_i], " [", cn_temp[2,col_i], "]")
  }
}

rawdata <- read_excel(path = "data/Medtest_e.xlsx",
                      skip = 2, col_names = FALSE,
                      sheet = 2)

```

New names:

```

* `` -> `...1`
* `` -> `...2`
* `` -> `...3`
* `` -> `...4`
* `` -> `...5`
* `` -> `...6`
* `` -> `...7`
* `` -> `...8`
* `` -> `...9`
* `` -> `...10`
* `` -> `...11`
* `` -> `...12`
* `` -> `...13`
* `` -> `...14`
* `` -> `...15`
* `` -> `...16`
* `` -> `...17`
* `` -> `...18`
* `` -> `...19`
* `` -> `...20`
* `` -> `...21`
* `` -> `...22`
* `` -> `...23`
* `` -> `...24`
* `` -> `...25`

```

```
colnames(rawdata) <- cn_temp[1,]
```

4.3 Import from SPSS/SAS

Import from SPSS generic files is implemented in various packages:

- `foreign::read.spss` is a more base approach,
 - on the positive side it has an option to read in value labels
 - on the other hand it returns lists or data frames, so casting into tibble is advised
 - `haven::read_sav` comes from tidyverse
 - variable- and value-labels are imported into attributes
 - as factor uses value labels

```
import1 <- read.spss(file = "data/Zellbeads.sav",
                      to.data.frame = TRUE,
                      use.value.labels = TRUE)
```

Zurückkodierung von CP1252

```
str(import1)
```

```

5 Changing structure wide <-> long

When working with repeated measures (e.g. follow-ups or changes over shorter periods of time) there are two typical formats:

1. wide data:

ID	Var1Time1	Var1Time2	Var2Time1	Var2Time2
P1				
P2				
P3				

2. long data

ID	Time	Var1	Var2
P1	1		
P1	2		
P2	1		
P2	2		
P3	1		
P3	2		

While long data can be seen as the tidier version and is necessary for many statistical procedures, the wide format makes computation of differences and procedures as the t-test for dependent samples easier. Package `tidyverse` provides the functions `pivot_wider` and `pivot_longer` for conversations between those forms. Another use-case is the plotting of several variables into ggplot facets, which can be achieved by combining those variables into a single column. Summarizing several variables and grouped data may result in a wide table with groups as rows and variables as columns, contrary to the common opposite form, another use-case.

There are many examples and explanations in the vignette:

<https://tidyverse.org/articles/pivot.html>

```
pacman::p_load(conflicted,tidyverse, wrappedtools)
```

5.1 Example 1: single repeated measure

```
n <- 3
wide_data <- tibble(ID = paste("P",1:n),
                      Var1 = LETTERS[1:n],
                      Var2Time1 = rnorm(n = n, mean = 100, sd = 15),
                      Var2Time2 = Var2Time1 + rnorm(n,10,5))
wide_data

# A tibble: 3 x 4
#>   ID   Var1  Var2Time1  Var2Time2
#>   <chr> <chr>     <dbl>      <dbl>
#> 1 P 1    A         104.       109.
#> 2 P 2    B         78.6       84.1
#> 3 P 3    C         89.6       97.7
```

```
long_data <- pivot_longer(
  data = wide_data,
  cols = contains("Time")
)
long_data
```

```
# A tibble: 6 x 4
#>   ID   Var1  name      value
#>   <chr> <chr> <chr>     <dbl>
#> 1 P 1    A    Var2Time1 104.
#> 2 P 1    A    Var2Time2 109.
#> 3 P 2    B    Var2Time1  78.6
#> 4 P 2    B    Var2Time2  84.1
#> 5 P 3    C    Var2Time1  89.6
#> 6 P 3    C    Var2Time2  97.7
```

5.2 Example 2: several repeated measures

```
wide_data <- tibble(ID = paste("P",1:n),
                      Var1Time1 = rnorm(n = n, mean = 100, sd = 15),
                      Var1Time2 = Var1Time1 + rnorm(n,10,5),
                      Var2Time1 = rnorm(n = n, mean = 10, sd = 2),
                      Var2Time2 = Var2Time1 + rnorm(n,0,1),
                      Var3 = LETTERS[1:n])
wide_data
```

```
# A tibble: 3 x 6
  ID    Var1Time1 Var1Time2 Var2Time1 Var2Time2 Var3
  <chr>     <dbl>     <dbl>     <dbl>     <dbl> <chr>
1 P 1       107.      119.      13.4      15.0  A
2 P 2       113.      114.      12.2      12.5  B
3 P 3       108.      112.      10.6      9.06 C
```

```
# version with intermediate step:
very_long_data <- pivot_longer(
  data = wide_data,
  cols = contains("Time"),
  names_to = c("Variable", "Time"),
  names_pattern = "(Var\\d+)(Time[12])",
  values_to = "Value"
)
very_long_data
```

```
# A tibble: 12 x 5
  ID    Var3 Variable Time   Value
  <chr> <chr> <chr>   <chr>  <dbl>
1 P 1   A     Var1    Time1  107.
2 P 1   A     Var1    Time2  119.
3 P 1   A     Var2    Time1  13.4
4 P 1   A     Var2    Time2  15.0
5 P 2   B     Var1    Time1  113.
6 P 2   B     Var1    Time2  114.
7 P 2   B     Var2    Time1  12.2
8 P 2   B     Var2    Time2  12.5
9 P 3   C     Var1    Time1  108.
10 P 3  C     Var1    Time2  112.
11 P 3  C     Var2    Time1  10.6
12 P 3  C     Var2    Time2  9.06
```

```
long_data <- pivot_wider(very_long_data,
                         names_from = Variable,
                         values_from = Value)
long_data
```

```
# A tibble: 6 x 5
  ID    Var3 Time   Var1  Var2
  <chr> <chr> <chr> <dbl> <dbl>
1 P 1   A    Time1  107. 13.4
2 P 1   A    Time2  119. 15.0
```

```

3 P 2     B      Time1  113. 12.2
4 P 2     B      Time2  114. 12.5
5 P 3     C      Time1  108. 10.6
6 P 3     C      Time2  112.  9.06

```

```

# alternatively in 1 step:
long_data <- pivot_longer(
  data=wide_data,
  cols=contains("Time"),
  names_to = c(".value","Time"), # .value will be replaced dynamically
  names_pattern = "(Var\\d+)(Time\\d+)"
)
long_data

```

```

# A tibble: 6 x 5
  ID    Var3  Time   Var1  Var2
  <chr> <chr> <chr> <dbl> <dbl>
1 P 1    A     Time1  107. 13.4
2 P 1    A     Time2  119. 15.0
3 P 2    B     Time1  113. 12.2
4 P 2    B     Time2  114. 12.5
5 P 3    C     Time1  108. 10.6
6 P 3    C     Time2  112.  9.06

```

5.3 Example 3: long to wide

```

wide_again_data <- pivot_wider(
  data = long_data,
  names_from = Time,
  values_from = Var1:Var2,
  names_glue = "{.value}@{Time}"
)
wide_again_data

```

```

# A tibble: 3 x 6
  ID    Var3  `Var1@Time1` `Var1@Time2` `Var2@Time1` `Var2@Time2`
  <chr> <chr>       <dbl>       <dbl>       <dbl>       <dbl>
1 P 1    A          107.        119.       13.4       15.0
2 P 2    B          113.        114.       12.2       12.5
3 P 3    C          108.        112.       10.6       9.06

```

5.4 More examples

5.4.1 Step 1: Create example data:

- 5 subjects per group, 2 groups A/B
- 3 measurements weight (V1, V2, V3) with random numbers,
 - means 46, 50, 51
 - SDs 2
- 2 measurements length (V1, V3) #no visit 2!
 - means 120, 135
 - SDs 3

```
n <- 10
rawdata <-
  tibble(ID=paste("Pat",seq_len(n), sep="#"),
         groups=rep(c("A","B"), each=n/2),
         weight_V1=rnorm(n = n,mean = 46,sd = 2),
         weight_V2=rnorm(n = n,mean = 50,sd = 2),
         weight_V3=rnorm(n = n,mean = 51,sd = 2),
         size_V1=rnorm(n = n,mean = 120,sd = 3),
         size_V3=rnorm(n = n,mean = 135,sd = 3))

head(rawdata)
```

```
# A tibble: 6 x 7
  ID    groups weight_V1 weight_V2 weight_V3 size_V1 size_V3
  <chr> <chr>     <dbl>     <dbl>     <dbl>     <dbl>     <dbl>
1 Pat#1 A        47.0      51.1      47.7     118.     133.
2 Pat#2 A        46.5      49.5      53.6     121.     132.
3 Pat#3 A        49.2      55.1      49.1     120.     146.
4 Pat#4 A        48.7      48.4      51.3     119.     136.
5 Pat#5 A        45.9      47.8      52.1     123.     132.
6 Pat#6 B        45.6      52.3      51.7     121.     135.
```

5.4.2 Step 2: Transform that data to a long form:

- 1 column for weight
- 1 column for length
- 1 column for measurement time named “Visit”

```

# with intermediate super_long step
rawdata_long <-
  # to superlong
  pivot_longer(data = rawdata,
               cols = contains("V"),
               names_to = c("what_was_measured",
                           "Visit"),
               names_sep = "_",
               values_to = "weight_or_size") |>
  # from superlong to long
  pivot_wider(names_from = what_was_measured,
              values_from = weight_or_size)
head(rawdata_long)

```

```

# A tibble: 6 x 5
  ID   groups Visit weight size
  <chr> <chr>  <chr>  <dbl> <dbl>
1 Pat#1 A      V1     47.0  118.
2 Pat#1 A      V2     51.1   NA
3 Pat#1 A      V3     47.7  133.
4 Pat#2 A      V1     46.5  121.
5 Pat#2 A      V2     49.5   NA
6 Pat#2 A      V3     53.6  132.

```

```

# single step approach
rawdata_long2 <-
  pivot_longer(data = rawdata,
               cols = contains("V"),
               names_to = c(".value","Visit"),
               # .value will be replaced by weigh or size
               names_sep = "_")
head(rawdata_long2)

```

```

# A tibble: 6 x 5
  ID   groups Visit weight size
  <chr> <chr>  <chr>  <dbl> <dbl>
1 Pat#1 A      V1     47.0  118.
2 Pat#1 A      V2     51.1   NA
3 Pat#1 A      V3     47.7  133.
4 Pat#2 A      V1     46.5  121.
5 Pat#2 A      V2     49.5   NA
6 Pat#2 A      V3     53.6  132.

```

5.4.3 Step 3 Transform long to wide

```
# 2-steps
rawdata_wide <-
  pivot_longer(rawdata_long,
    cols = c(weight, size),
    names_to = "what_was_measured",
    values_to = "weight_or_size") |>
  pivot_wider(names_from=c(what_was_measured,Visit),
    # names created from 2 sources
    values_from = weight_or_size,
    names_sep = "_")
head(rawdata_wide)
```

```
# A tibble: 6 x 8
  ID   groups weight_V1 size_V1 weight_V2 size_V2 weight_V3 size_V3
  <chr> <chr>     <dbl>   <dbl>     <dbl>   <dbl>     <dbl>   <dbl>
1 Pat#1 A        47.0    118.      51.1     NA       47.7    133.
2 Pat#2 A        46.5    121.      49.5     NA       53.6    132.
3 Pat#3 A        49.2    120.      55.1     NA       49.1    146.
4 Pat#4 A        48.7    119.      48.4     NA       51.3    136.
5 Pat#5 A        45.9    123.      47.8     NA       52.1    132.
6 Pat#6 B        45.6    121.      52.3     NA       51.7    135.
```

```
# 1step option
rawdata_wide2 <-
  pivot_wider(rawdata_long,
    values_from = c(weight, size),
    # values come from 2 sources, names will used in names_glue
    names_from=Visit,
    names_glue=".value}_{Visit}")
head(rawdata_wide2)
```

```
# A tibble: 6 x 8
  ID   groups weight_V1 weight_V2 weight_V3 size_V1 size_V2 size_V3
  <chr> <chr>     <dbl>   <dbl>     <dbl>   <dbl>   <dbl>   <dbl>
1 Pat#1 A        47.0    51.1      47.7    118.     NA     133.
2 Pat#2 A        46.5    49.5      53.6    121.     NA     132.
3 Pat#3 A        49.2    55.1      49.1    120.     NA     146.
4 Pat#4 A        48.7    48.4      51.3    119.     NA     136.
5 Pat#5 A        45.9    47.8      52.1    123.     NA     132.
6 Pat#6 B        45.6    52.3      51.7    121.     NA     135.
```

6 Grouping of variables by type / distribution / use

```
pacman::p_load(conflicted, wrappedtools, tidyverse)
conflicts_prefer(dplyr::filter)
```

[conflicted] Will prefer dplyr::filter over any other package.

```
rawdata <- readRDS('data/rawdata.rds')
```

6.1 Test for Normal distribution

6.1.1 Testing a single variable

Before computing some test-statistics, a graphical exploration should be done by e.g. density plots.

There are a number of tests for Normal distribution, all testing the Null hypothesis of data coming from a population with Normal distribution. So small p-values lead to rejection of the Null and indicate deviation from normality. Kolmogorov-Smirnov-test (for larger sample sizes) and Shapiro-Wilk-test (for smaller samples) will be used as examples.

Other tests would be Liliefors, Anderson-Darling, and the Cramer-von Mises test.

```
ks.test(x = rawdata$`Size (cm)`,
        "pnorm",
        mean=mean(rawdata$`Size (cm)``,
                  na.rm = TRUE),
        sd=sd(rawdata$`Size (cm)``,
               na.rm = TRUE))
```

```
Warning in ks.test.default(x = rawdata$`Size (cm)` , "pnorm", mean =
mean(rawdata$`Size (cm)` , : ties should not be present for the one-sample
Kolmogorov-Smirnov test
```

Asymptotic one-sample Kolmogorov-Smirnov test

```
data: rawdata$`Size (cm)`  
D = 0.13284, p-value = 0.7064  
alternative hypothesis: two-sided
```

```
ksnormal(rawdata$`Size (cm)`)
```

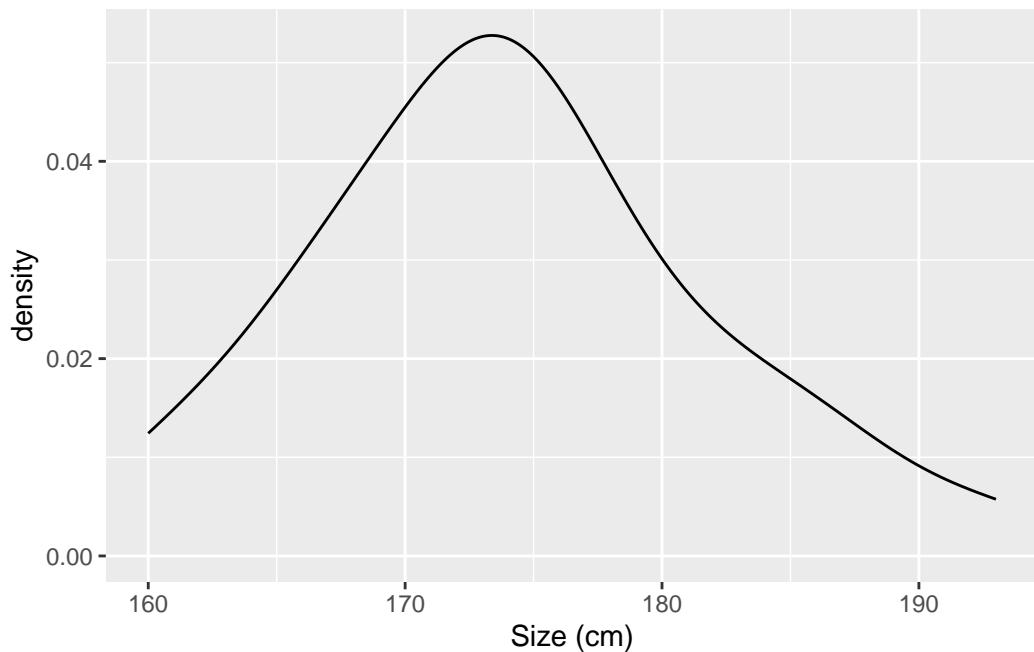

```
[1] 0.7063825
```

```
shapiro.test(rawdata$`Size (cm)`)
```

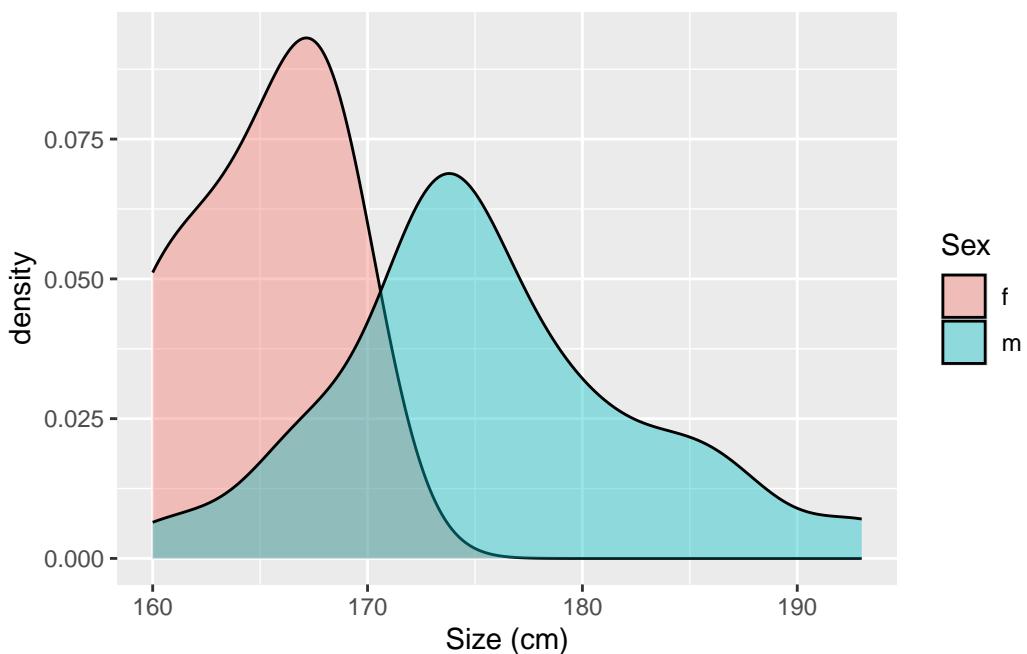

Shapiro-Wilk normality test

```
data: rawdata$`Size (cm)`  
W = 0.9766, p-value = 0.7627
```

```
ggplot(rawdata,aes(x = `Size (cm)`))+  
  geom_density()
```

```
ggplot(rawdata,aes(x = `Size (cm)`,fill=Sex))+  
  geom_density(alpha=.4)
```

If severe group difference can be expected (case/control, sex ...), exploration and analyses should be done in subgroups.

```
rawdata |> filter(Sex=="m") |>  
  pull(`Size (cm)`) |>  
  ksnormal()
```

```
[1] 0.5748486
```

```
rawdata |>  
  group_by(Sex) |>  
  summarize(p_KS = ksnormal(`Size (cm)`),  
            `pGauss (Shapiro)` = shapiro.test(`Size (cm)`)$p.value)
```

```
# A tibble: 2 x 3  
  Sex     p_KS `pGauss (Shapiro)`  
  <chr>   <dbl>          <dbl>  
1 f       0.905          0.272  
2 m       0.575          0.638
```

6.1.2 Testing several variables

To explore larger data sets, it may be useful to test all numerical variables for normality, this can be done in a loop or with the across-function. As a start for the loop-solution we can get the names and positions for all (or selected) numerical variables with the ColSeeker-function from wrappedtools.

```
numvars <- ColSeeker(varclass = "numeric")
numvars$index

[1] 1 2 3 4 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24

head(numvars$names)

[1] "Randomcode"      "Included"       "Finalized"       "Testmedication"
[5] "Size (cm)"       "Weight (kg)"

numvars$count

[1] 23
```

Loops can be created with either a numeric counter-like index or content-based index.

Loop Version 1:

```
## result table v1, pre-filled
resulttable1 <- tibble(
  Variables=numvars$names,
  pKS=NA_real_,
  pSh=NA_real_
)
## loop version 1
for(var_i in seq_len(numvars$count)){
  resulttable1$pKS[var_i] <-
    ksnormal(rawdata[[numvars$names[var_i]]])
  resulttable1$pSh[var_i] <-
    shapiro.test(rawdata |>
      pull(numvars$names[var_i]))$p.value
}
head(resulttable1)
```

```
# A tibble: 6 x 3
Variables          pKS      pSh
<chr>            <dbl>    <dbl>
1 Randomcode      0.999    3.10e- 1
2 Included        0.000000170 2.25e-11
3 Finalized       0.000000800 1.86e- 9
4 Testmedication  0.00347   4.31e- 7
5 Size (cm)       0.706    7.63e- 1
6 Weight (kg)     0.760    8.96e- 2
```

Loop Version 2:

```
## result table v2, just structure
resulttable2 <- tibble(Variables=NA_character_,
                      pKS_Placebo=NA_character_,
                      pKS_Verum=NA_character_,
                      .rows = 0)
for(var_i in numvars$names){
  ks_tmp <- by(data = rawdata[[var_i]],
                INDICES=rawdata$Testmedication,
                FUN=ksnormal)
  resulttable2 <-add_row(resulttable2,
                          Variables=var_i,
                          pKS_Placebo=ks_tmp[[1]] |>
                            formatP(), # added rounding/formatting
                          pKS_Verum=ks_tmp[[2]] |>
                            formatP())
}

```

```
rm(numvars)
```

6.2 Picking column names and positions

Based on data inspection, testing, and background knowledge, variables can be sorted into scale levels:

```

gaussvars <- ColSeeker(
  namepattern = c("si","we","BMI","BP","mri"),
  casesensitive = FALSE)

ordvars <- ColSeeker(namepattern = c("Age","Lab"))

factvars <- ColSeeker(namepattern = c("Sex","med","NYHA"),
                      returnclass = TRUE)

rawdata <- mutate(rawdata,
                  across(all_of(factvars$names),
                         ~factor(.x)))
save(rawdata,list = ls(pattern = "vars"),
     file = "data/bookdata1.RData")

```

7 Visualize data with ggplot

While there are various packages providing visualizations, here we are focusing on `ggplot2` (grammar of graphics) as a very flexible and versatile approach with many extensions implemented in additional packages. See e.g. <https://exts.ggplot2.tidyverse.org/>.

```
pacman::p_load(conflicted, tidyverse,
  grid,gridExtra,car,
  ggsci,ggsignif, ggthemes, ggridges,
  # gganimate,
  ggforce,
  ggbeeswarm,
  wrappedtools,
  emojiifont,
  patchwork)
conflicts_prefer(dplyr::filter) # solves name conflict
```

[conflicted] Will prefer `dplyr::filter` over any other package.

7.1 Example data

The typical examples use either diamonds from `ggplot2` or mtcars from `datasets`. There are help files for both.

```
head(diamonds)

# A tibble: 6 x 10

7.2 Basic structure of a ggplot call

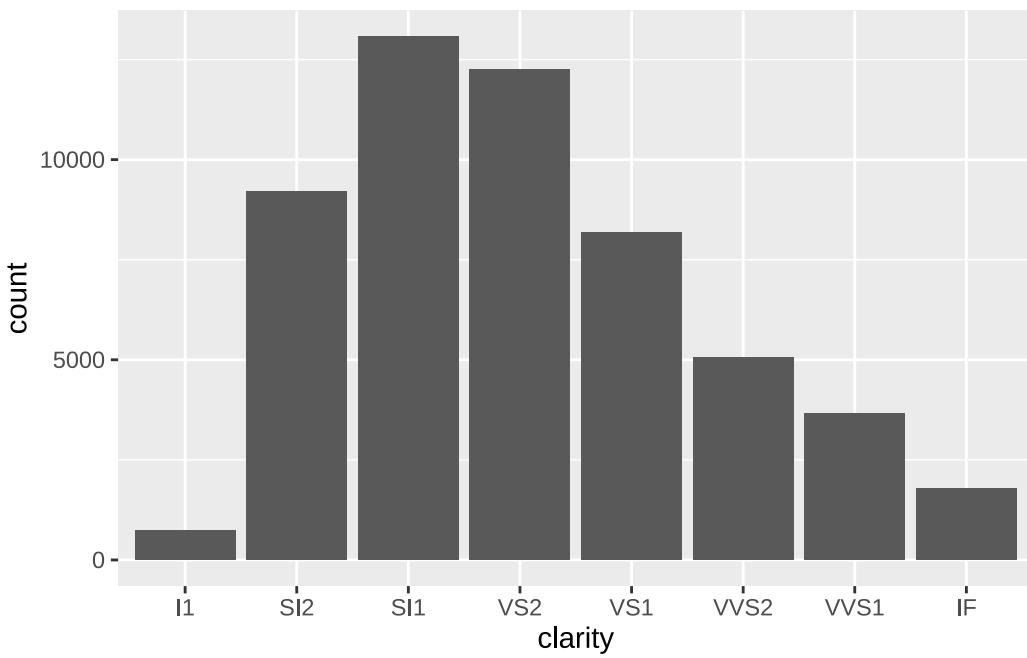

To create a figure, we at least use 2 function calls:

1. `ggplot(data = my_data, mapping = aes(x=..., y=..., color=..., shape=...))` to define data and inside `aes()` some global defaults for aesthetic mappings, this (sort of) creates the canvas to draw on
2. `geom_xxx()` to define the geometry to be used to show the data, e.g. bar, boxplot, point

When mapping data to aesthetics, the class of data matters: Numerical data are interpreted as continuous, so a color heatmap is mapped rather than discrete colors, grouping of data requires factors / characters.

Minimal example:

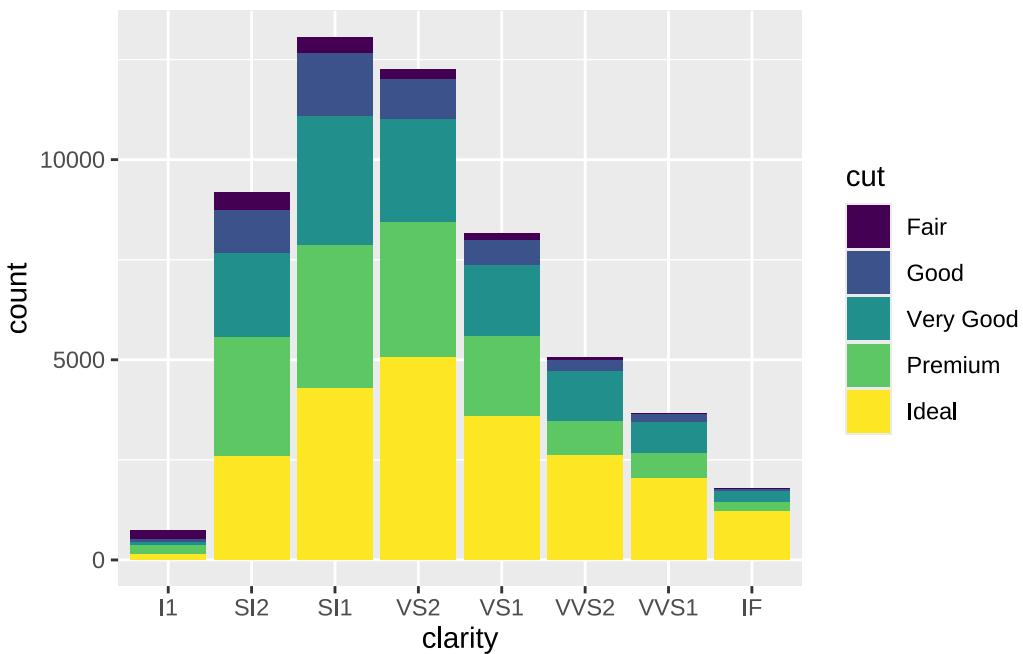

```
ggplot(data=diamonds, mapping = aes(x=clarity))+  
  geom_bar()
```

`geom_bar()` inherits the global aesthetic `x` (*build a x-axis based on values in column clarity*) and does not need a y-axis definition, as it uses some in-build statistics (“count”) and defines `y`.

We can add additional aesthetic parameters like `fill=`. This automatically creates sub-groups for counting:

```
ggplot(data=diamonds,aes(x=clarity,fill=cut))+  
  geom_bar()
```

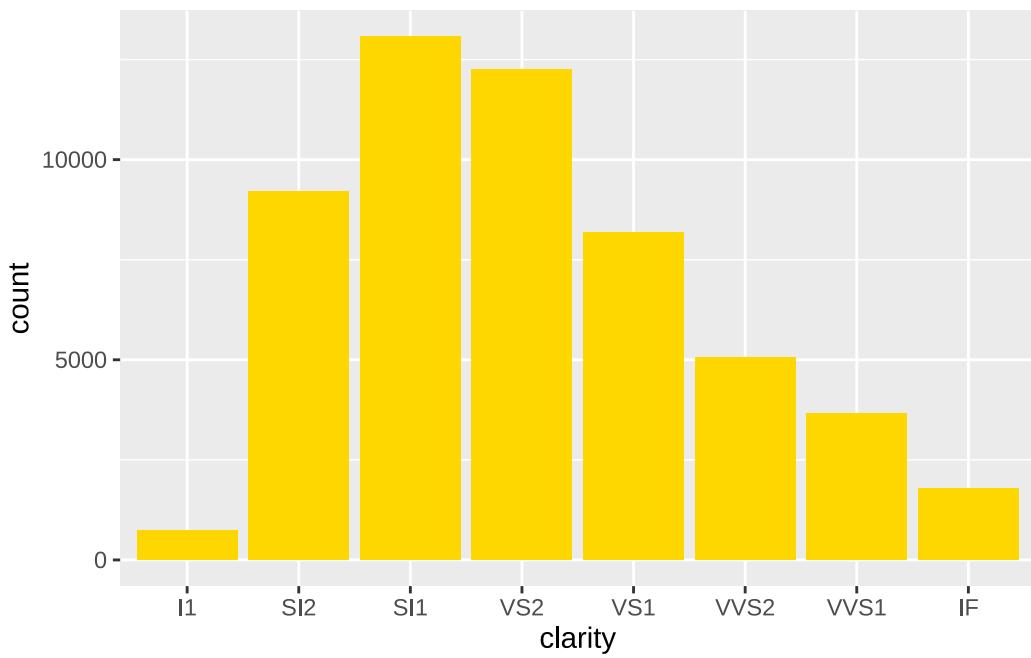

This graph represents this count table:

```
diamonds |>
  group_by(clarity,cut) |>
  count() |>
  pivot_wider(names_from = clarity,values_from=n)
```

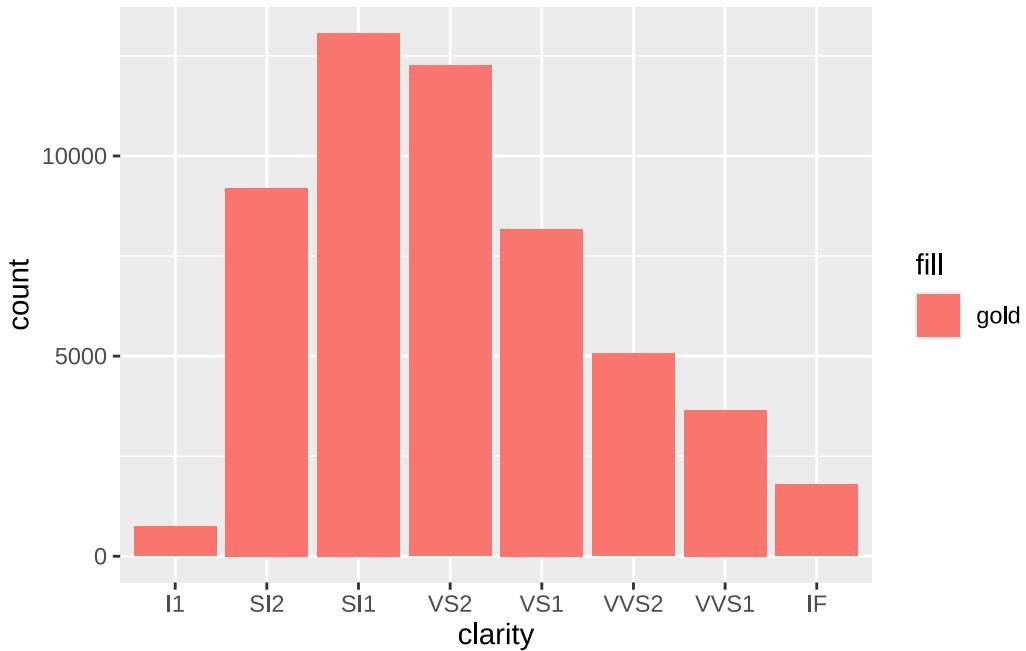

```
# A tibble: 5 x 9
# Groups:   cut [5]
  cut      I1    SI2    SI1    VS2    VS1    VVS2   VVS1    IF
  <ord>  <int> <int> <int> <int> <int> <int> <int>
1 Fair     210   466   408   261   170    69     17     9
2 Good     96   1081  1560   978   648   286   186    71
3 Very Good  84   2100  3240  2591  1775  1235   789   268
4 Premium   205   2949  3575  3357  1989   870   616   230
5 Ideal     146   2598  4282  5071  3589  2606  2047  1212
```

Aesthetic parameters can represent data / have some meaning (as cut quality), but they can be defined to reflect your taste rather than data. In that case, you define them outside of `aes()`. Careful, as this may lead to confusion:

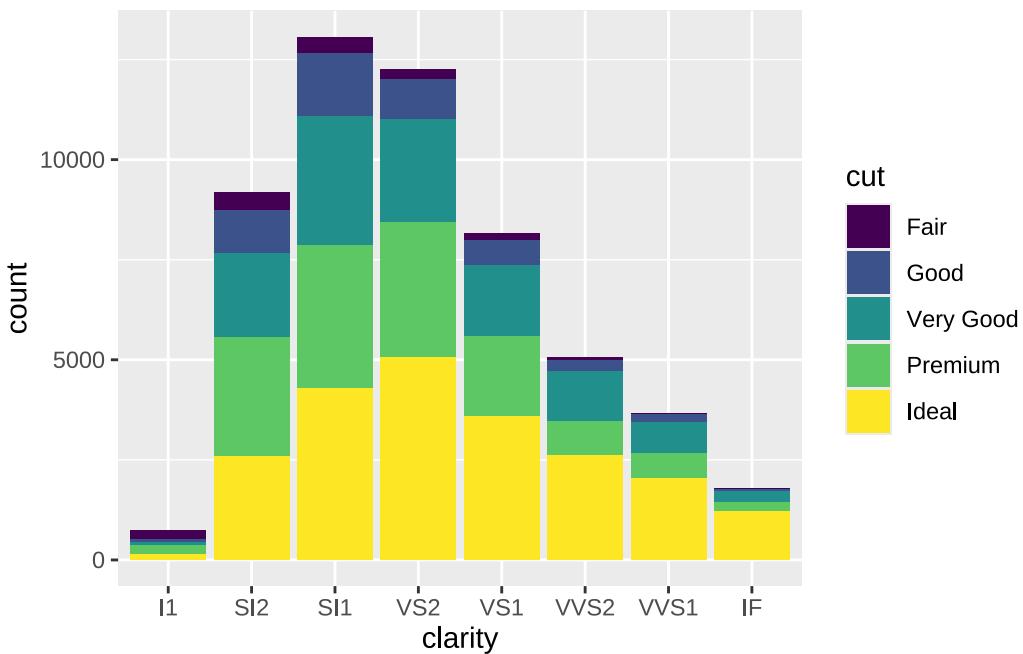

```
#aesthetics outside aes
ggplot(data=diamonds,aes(x=clarity))+  
  geom_bar(fill="gold")
```

```
ggplot(data=diamonds,aes(x=clarity))+
  geom_bar(aes(fill="gold")) #should be outside aes!
```

```
ggplot(data=diamonds,aes(x=clarity))+
  geom_bar(aes(fill=cut)) # may be defined locally as well globally
```

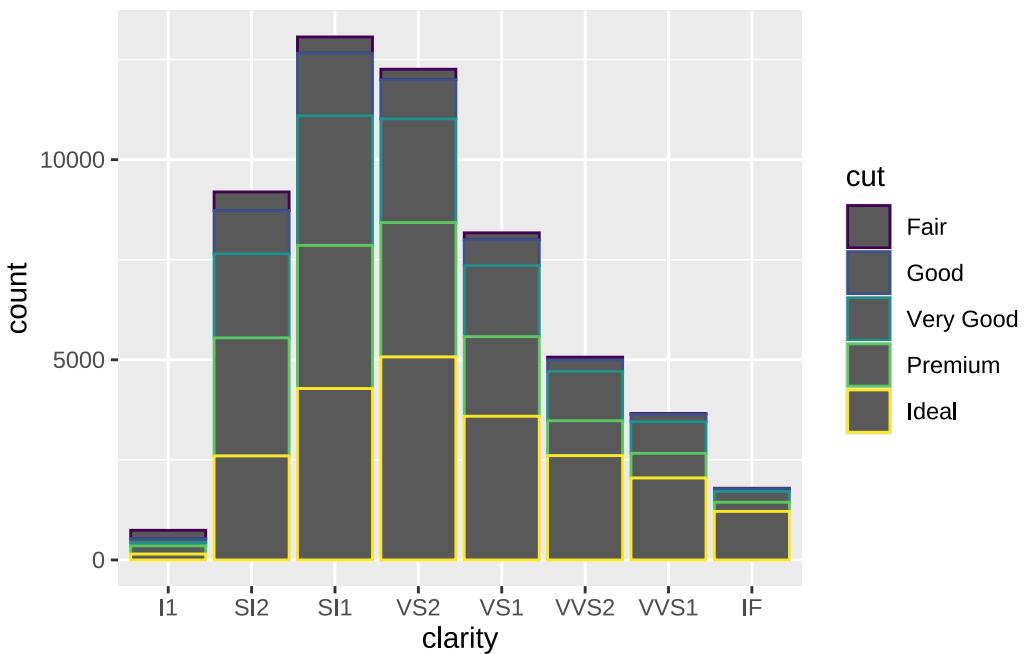

7.3 fill vs. color

Some elements (as e.g. the bar or boxplot) know 2 color elements:

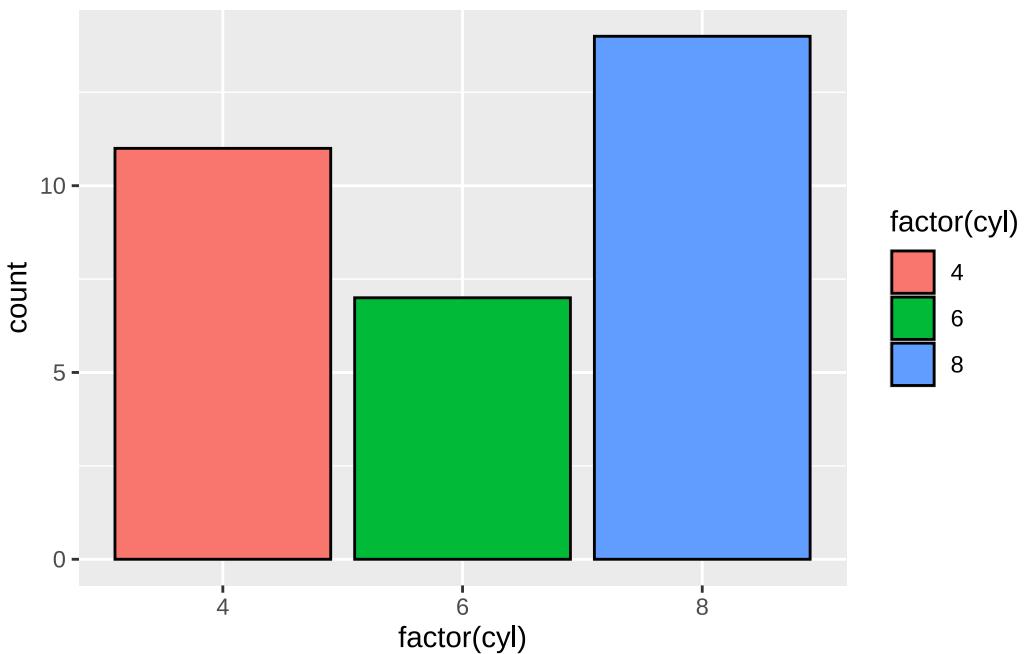

- inner color, defined by `fill`
- outer frame color, defined by `color`

Other elements (as e.g. the line) only have a single color definition, specified by `color`. And for some elements (as e.g. dots), it depends. See help for points for examples.

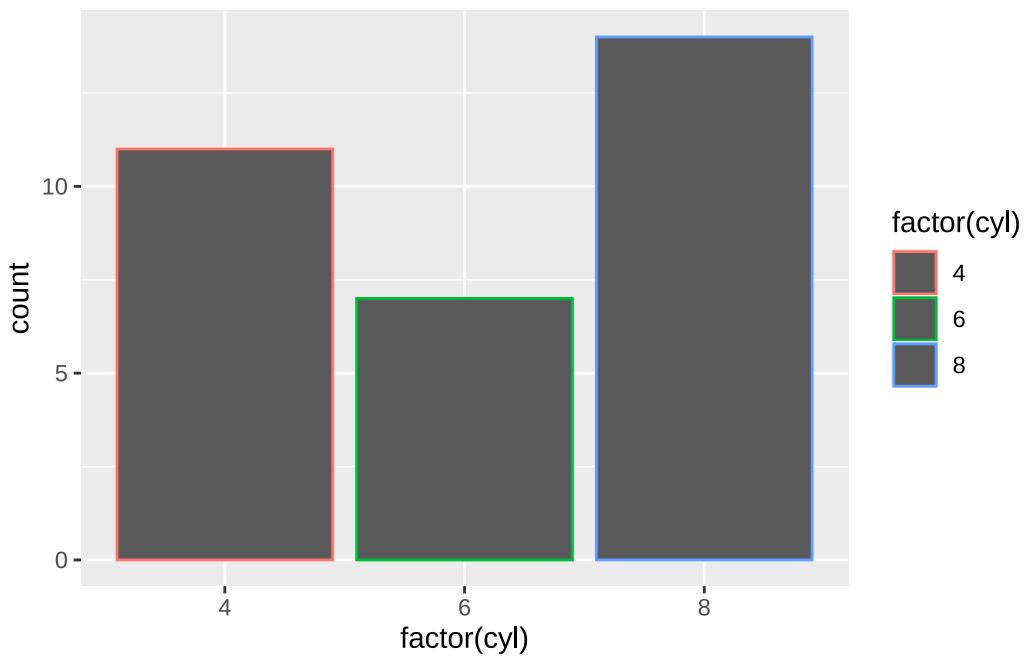

```
ggplot(data=diamonds,aes(x=clarity,color=cut))+  
  geom_bar()
```

```
ggplot(data=mtcars,aes(factor(cyl),fill=factor(cyl)))+
  geom_bar(color="black")
```

```
ggplot(data=mtcars,aes(factor(cyl),color=factor(cyl)))+
  geom_bar()
```

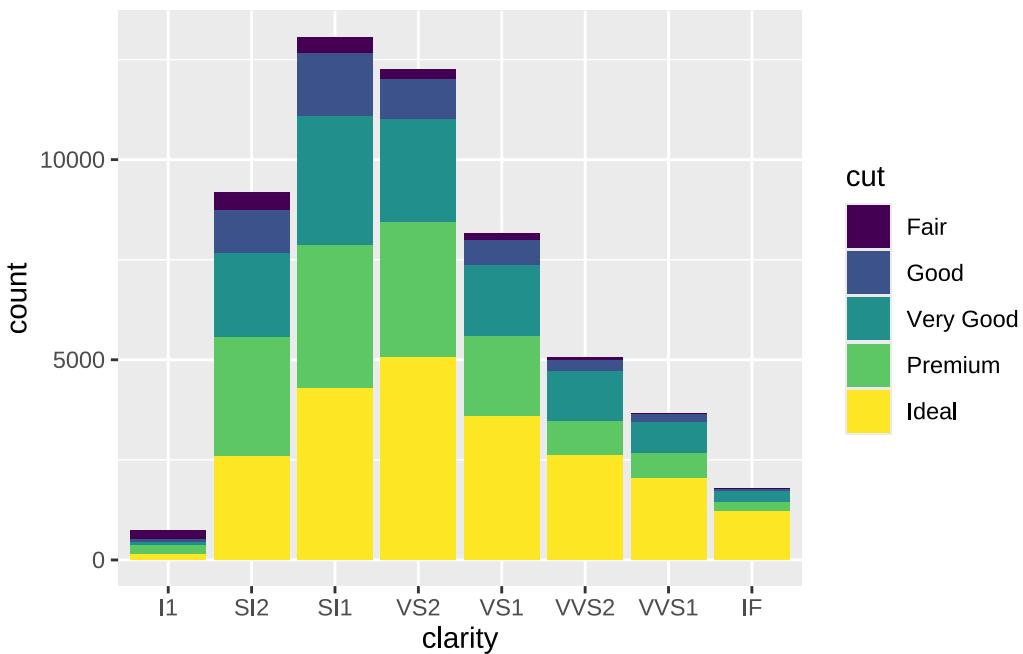

7.4 Color systems

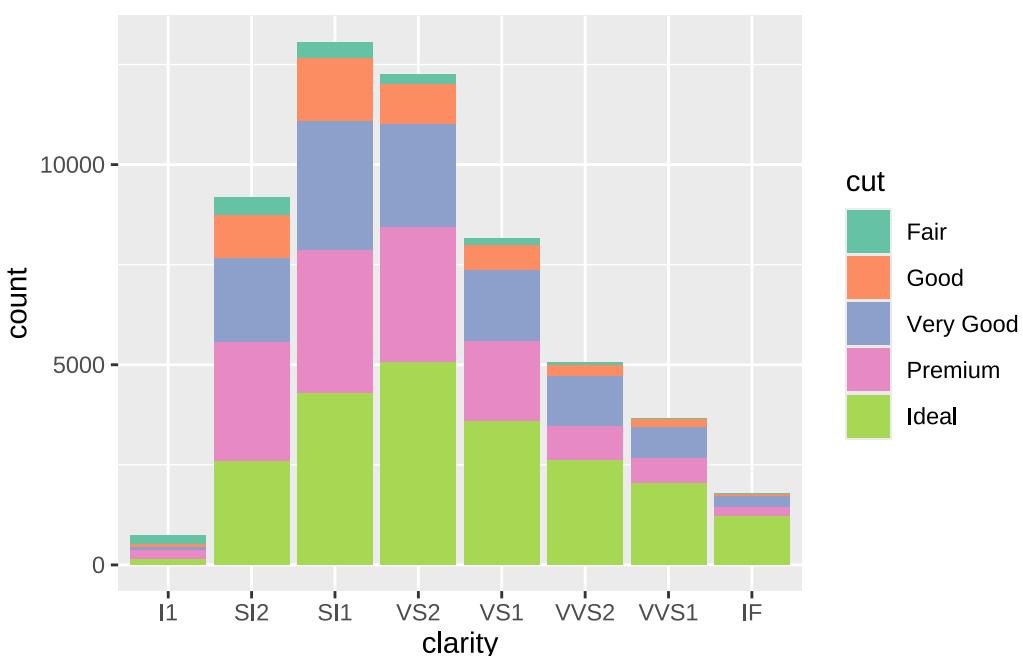

ggplot2 comes with various color definitions, many external packages extend that. Manual definition of colors is possible as well. Redefining the mapping between data and aesthetics can be done with `scale_...` functions

For the demonstration, I store a plot into a variable, this includes all data and plot definitions, nothing like jpg!

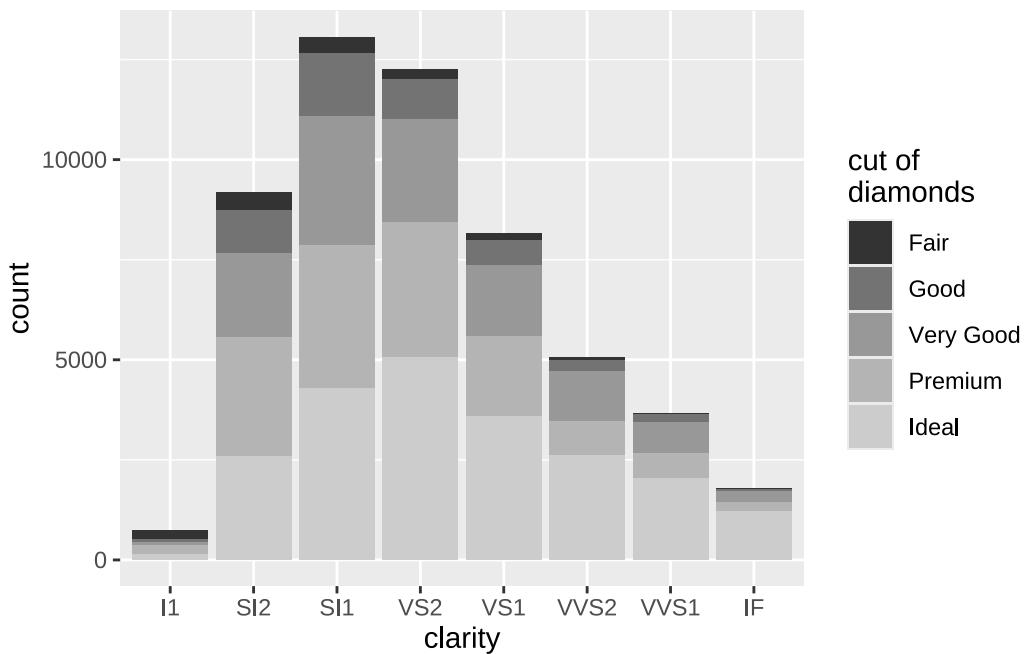

```
(plottemp <- ggplot(data=diamonds, aes(x=clarity, fill=cut))+
  geom_bar())
```

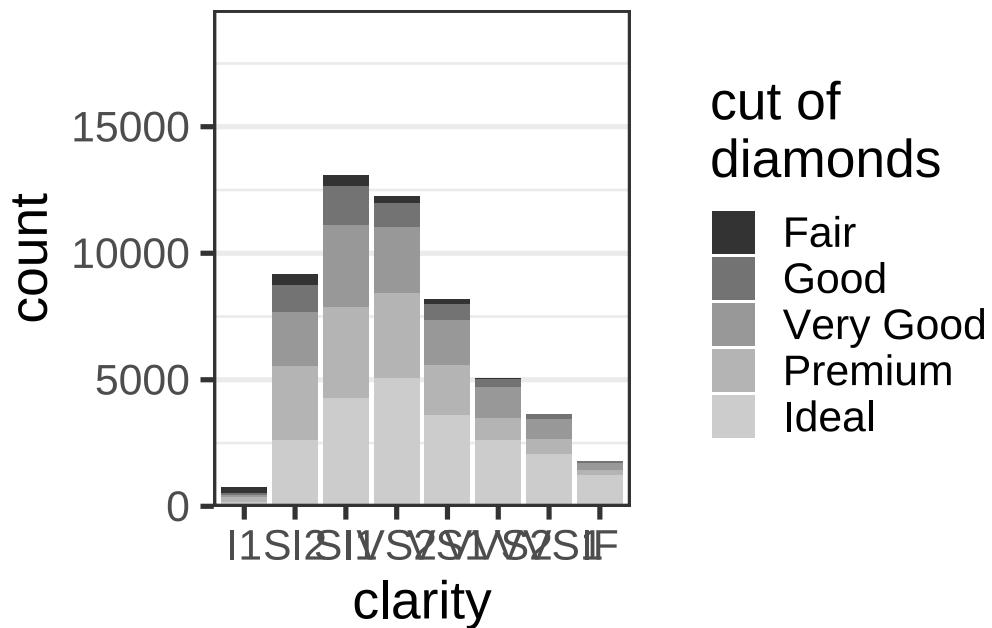

```
plottemp + scale_fill_brewer(palette="Set2") #in-built "scale" for fill
```

```
plottemp + scale_fill_grey(name = "cut of\ndiamonds")
```

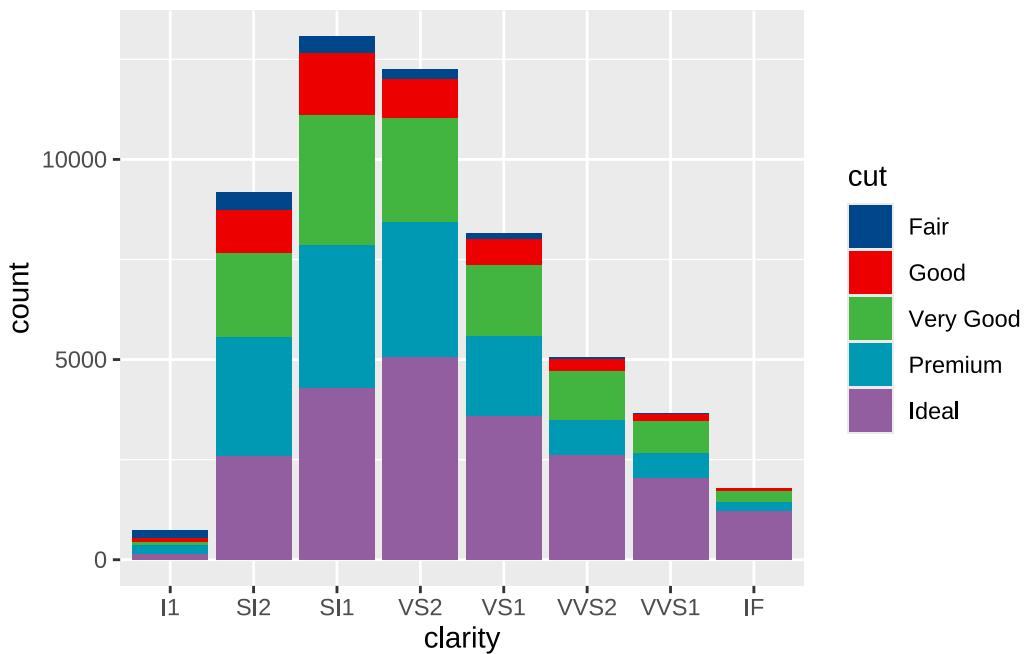

```
plottemp + scale_fill_grey(name = "cut of diamonds") +
  scale_y_continuous(expand = expansion(mult = c(0,.5)))+ # rescaling y
  theme_bw(base_size = 20) +
  theme(panel.grid.major.x = element_blank())
```

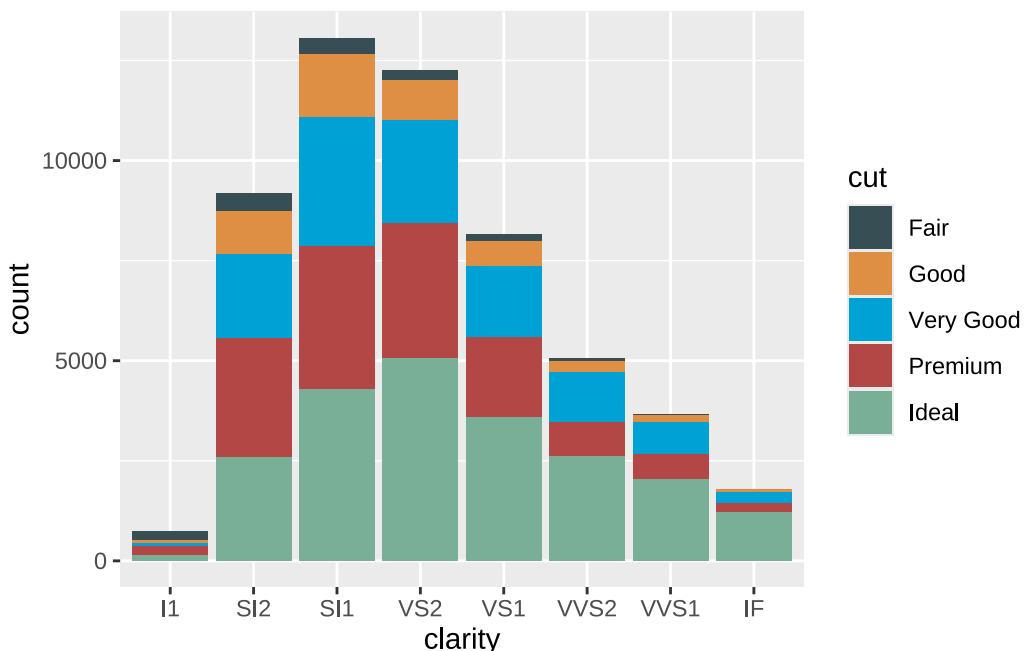

7.4.1 External color definitions from ggsci

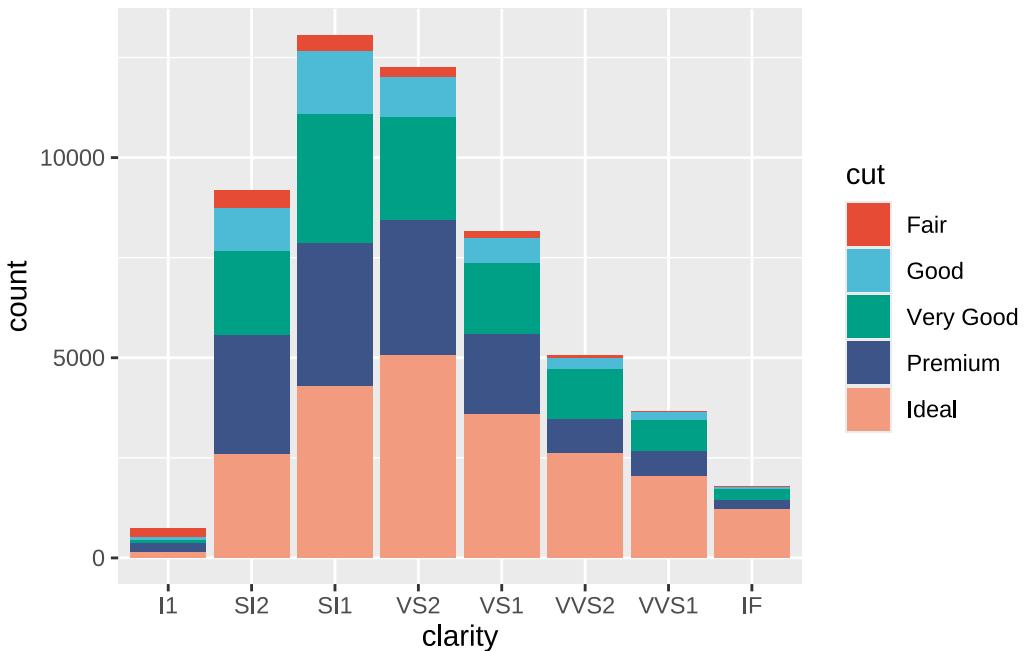

```
plottemp+scale_fill_lancet()
```

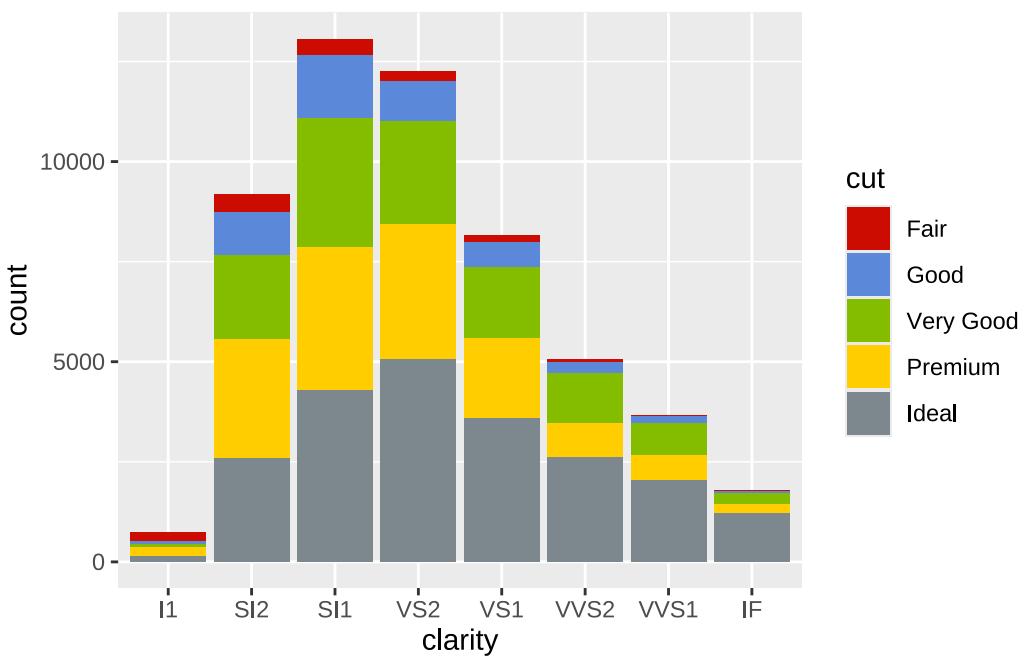

```
plottemp+scale_fill_jama()
```

```
plottemp+scale_fill_npg()
```

```
(printplot <- plottemp+scale_fill_startrek())
```

7.5 Exporting ggplots

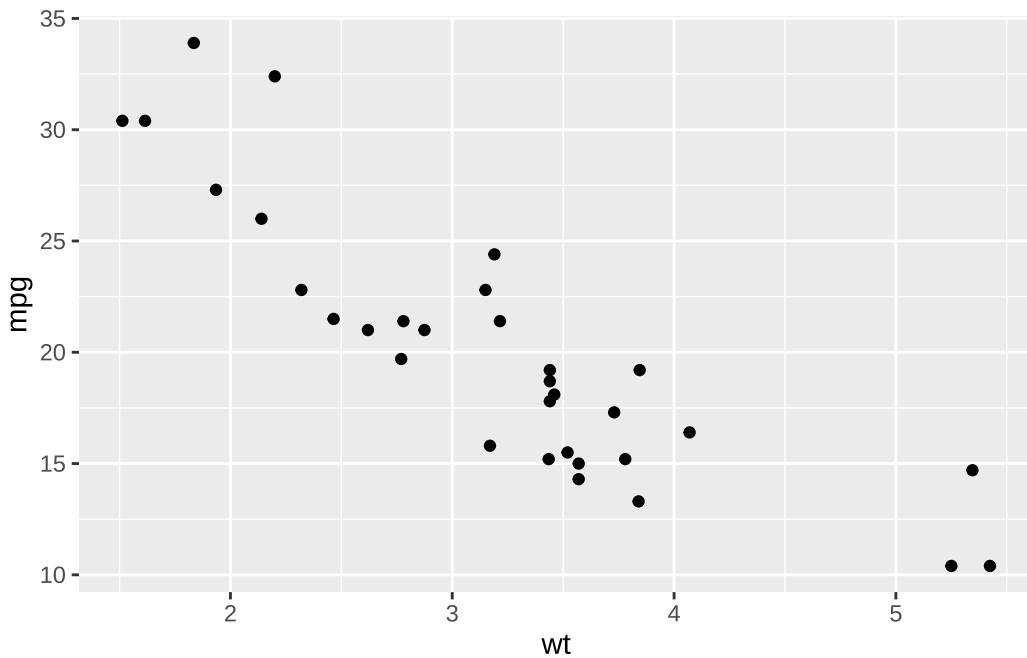

There are two distinct ways, using `ggsave()` or more generally creating an external graphic device with e.g. `png()` / `tiff()` / `pdf()`:

```
ggsave(filename = "Graphs/ggtestplot.png",
       plot = printplot,
       width=20,height=20,
       units="cm",dpi=150)
ggsave(filename = "Graphs/ggtestplot.tiff",
       plot = printplot,
       width=20,height=20,
       units="cm",dpi=600)
ggsave(filename = "Graphs/ggtestplot_c.tiff",
       plot = printplot,
       width=20,height=20, compression="lzw",
       units="cm",dpi=600)
# alternative:
png(filename = "Graphs/ggtestplot2.png",
     width = 20,height = 20,units = "cm",res = 150)
plottemp
dev.off()
```

7.6 Other geoms

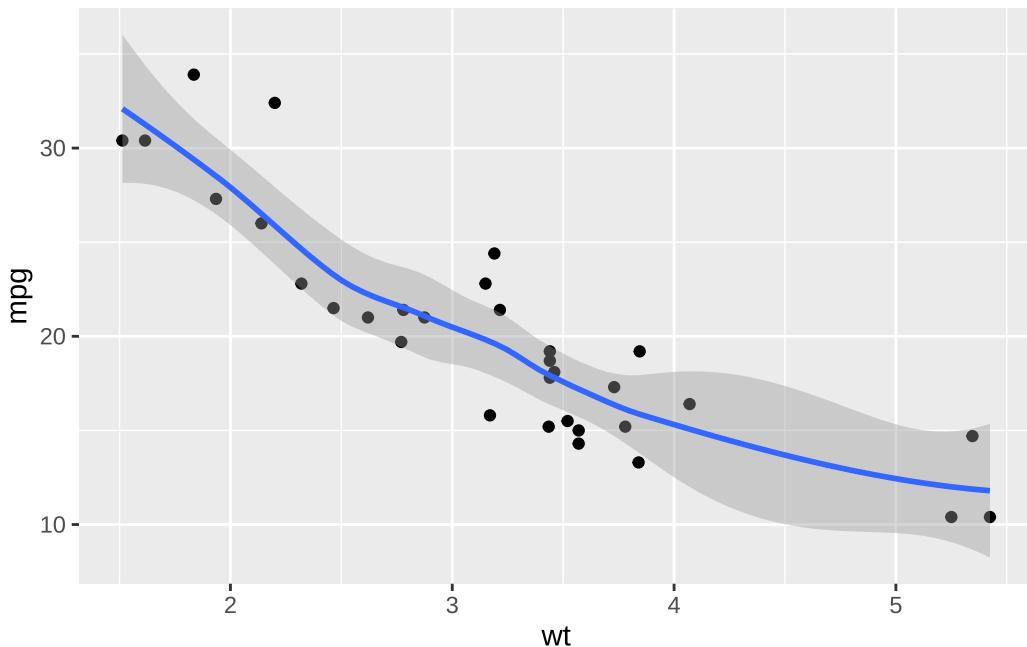

Common forms of plots are barplots, boxplots, scatterplots (possibly with regression line), and density-plots. For plotting dots for groups, there are various options to avoid overplotting of repeated data, with the `beeswarm` as my preference.

```
ggplot(data=mtcars,aes(x = wt,y = mpg))+  
  geom_point()
```

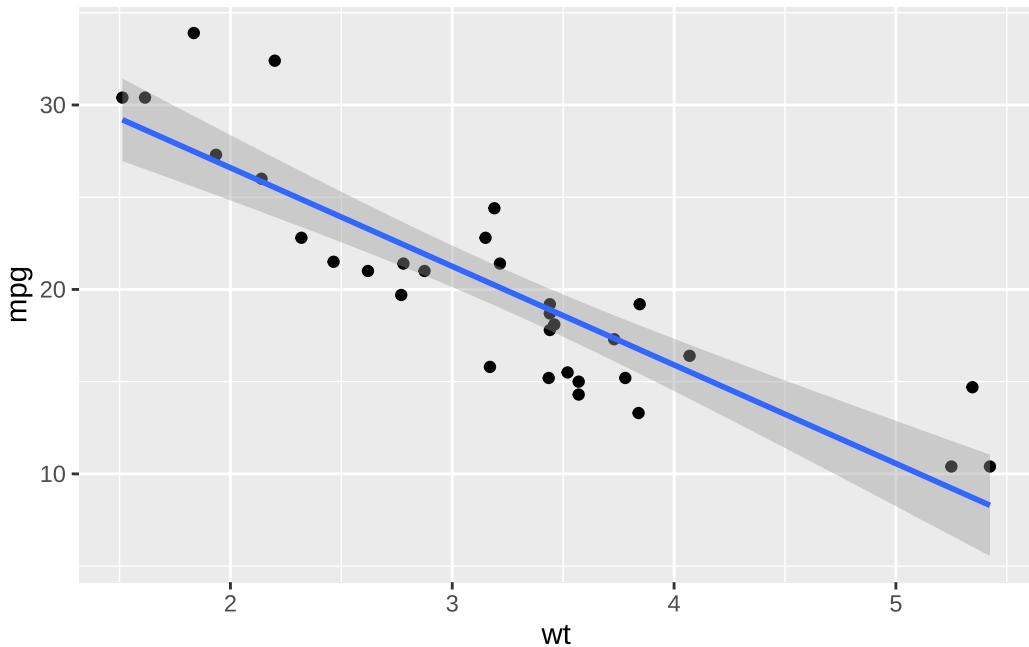

```
ggplot(data=mtcars,aes(x = wt,y = mpg))+  
  geom_point() +  
  geom_smooth()
```

```
`geom_smooth()` using method = 'loess' and formula = 'y ~ x'
```

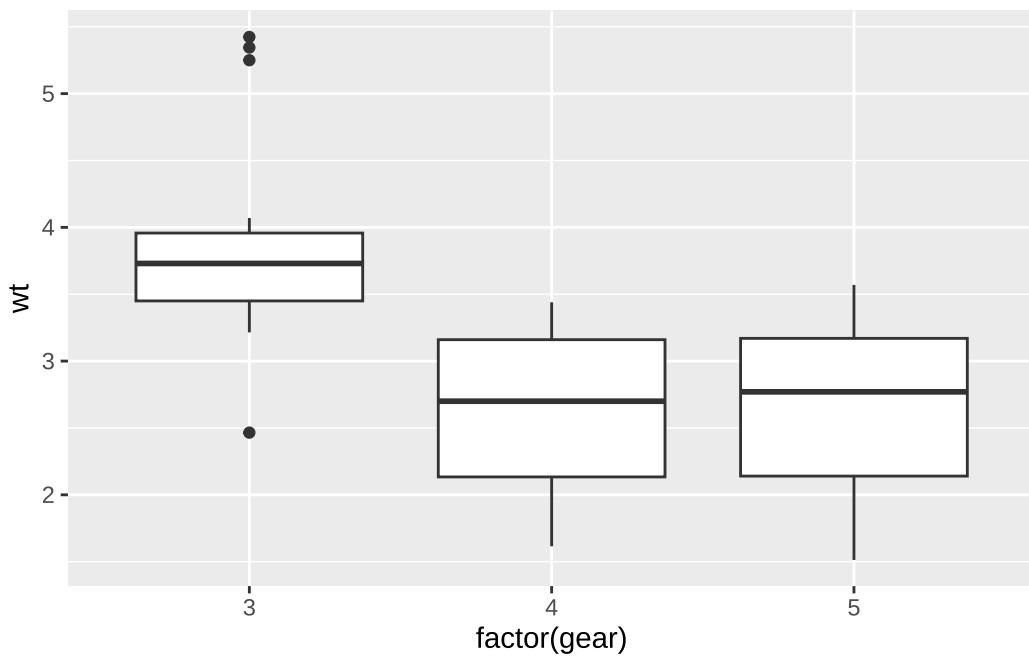

```
ggplot(data=mtcars,aes(x = wt,y = mpg))+  
  geom_point() +  
  geom_smooth(method="lm")
```

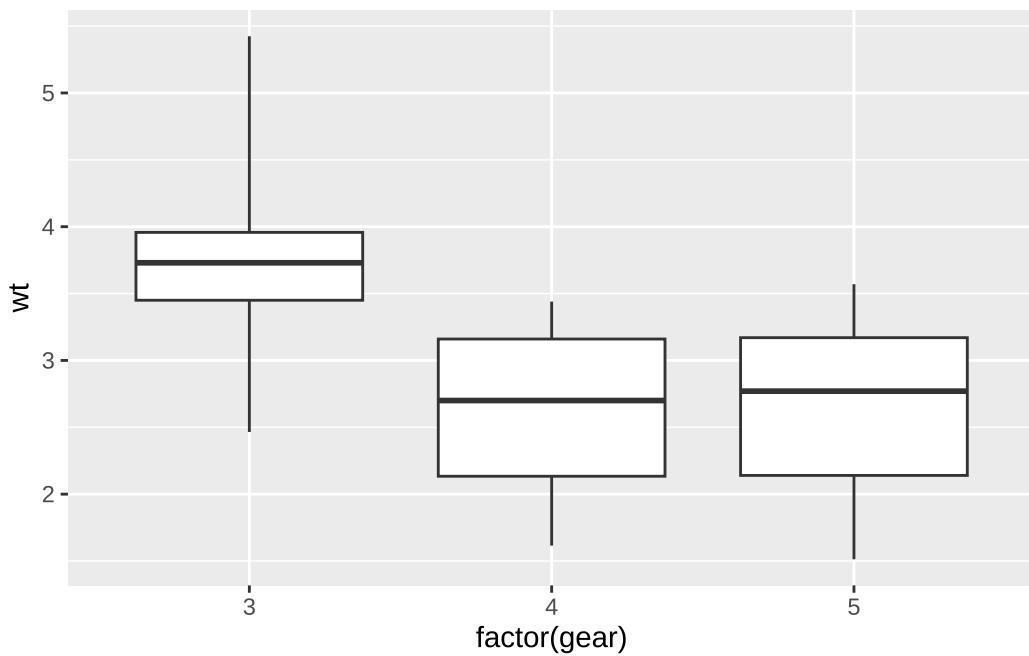

`geom_smooth()` using formula = 'y ~ x'

```
ggplot(mtcars,aes(x = factor(gear),y = wt))+  
  geom_boxplot() #default 1.5 IQR
```

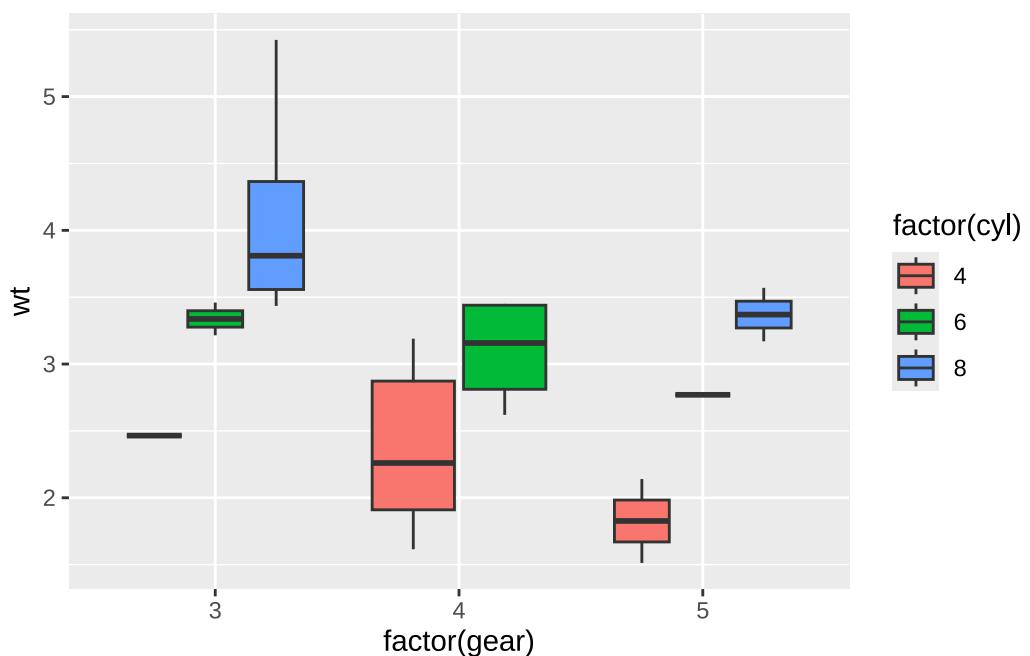

```
ggplot(mtcars,aes(x = factor(gear),y = wt))+  
  geom_boxplot(coef=3) # this extends range of expected values
```

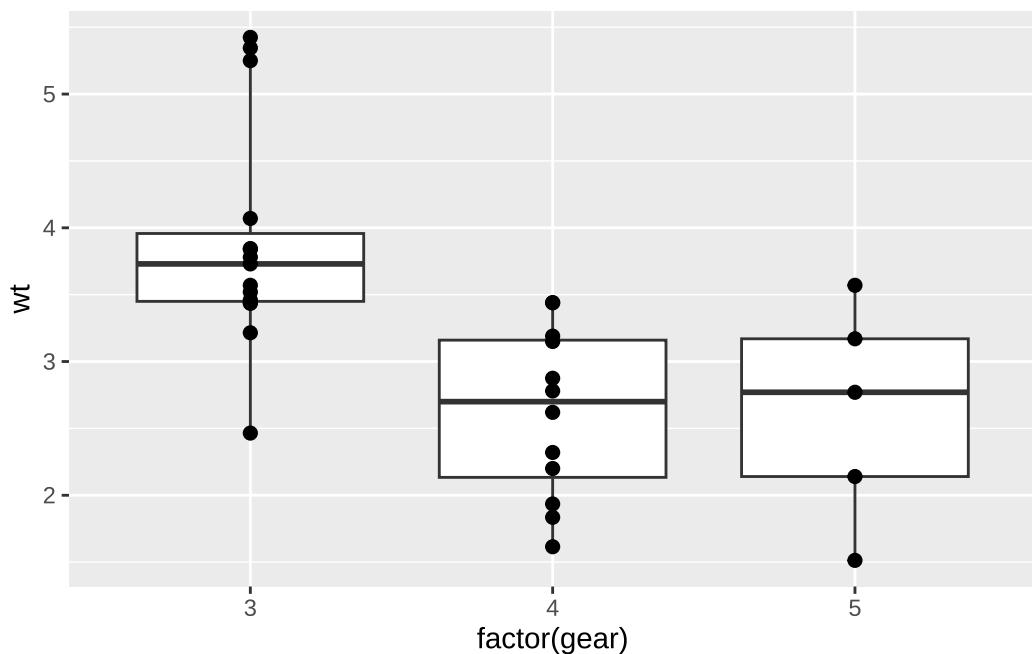

```
ggplot(mtcars,aes(x = factor(gear),y = wt,  
  fill=factor(cyl)))+
```

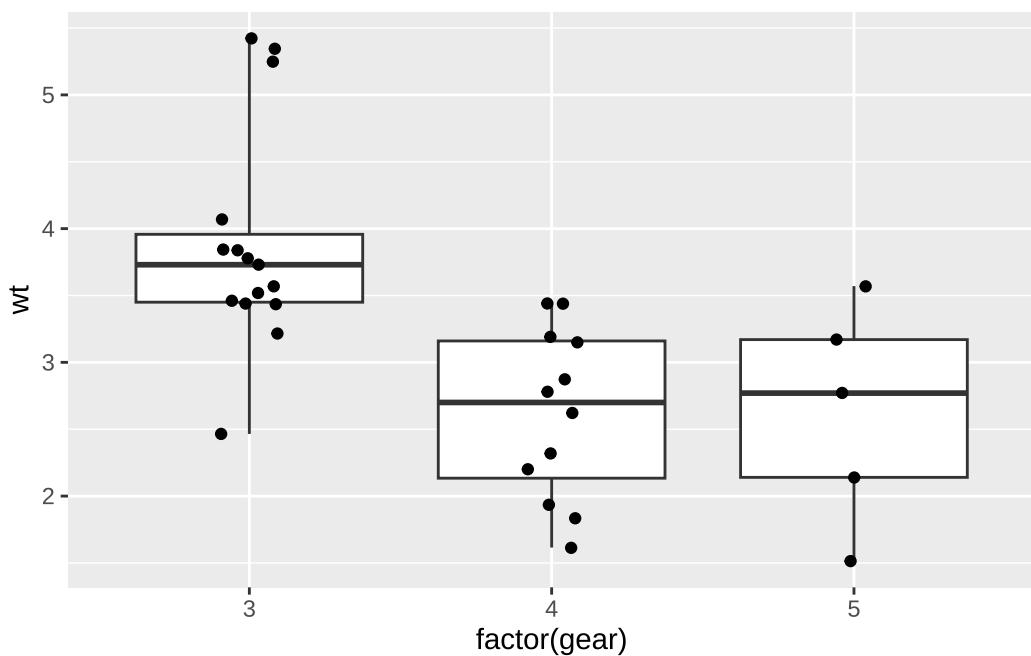

```
geom_boxplot(coef=3) # group by cyl, as it is mapped to fill
```

```
ggplot(mtcars,aes(x = factor(gear),y = wt))+  
  geom_boxplot(coef=3)+  
  geom_point(size=2) # may contain overlapping points
```

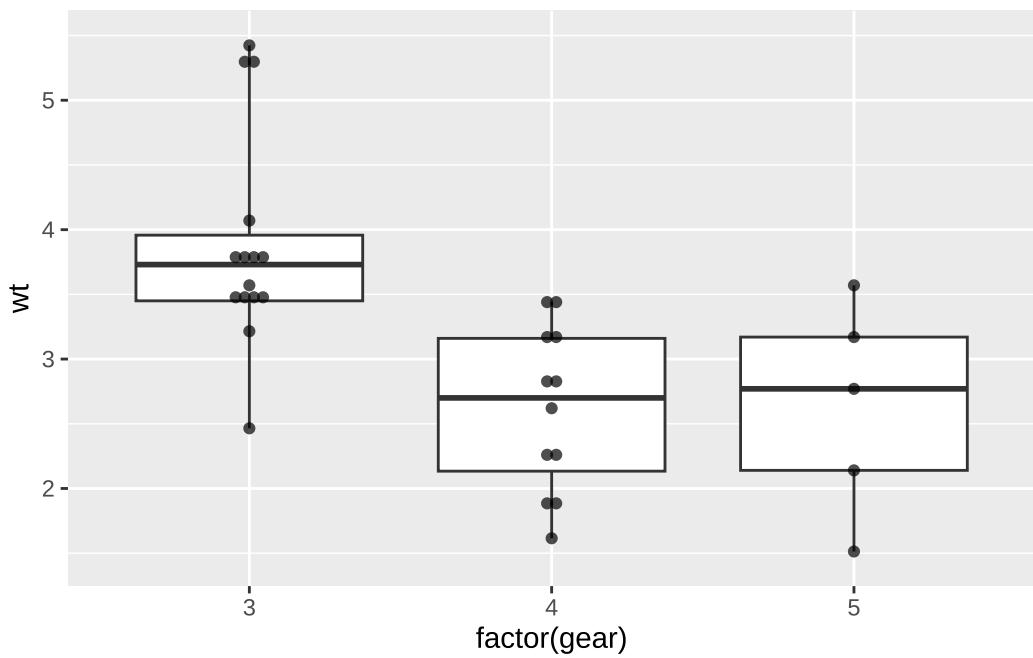

```
ggplot(mtcars,aes(x = factor(gear),y = wt))+  
  geom_boxplot(coef=3)+  
  geom_point(position = position_jitter(width = .1))
```

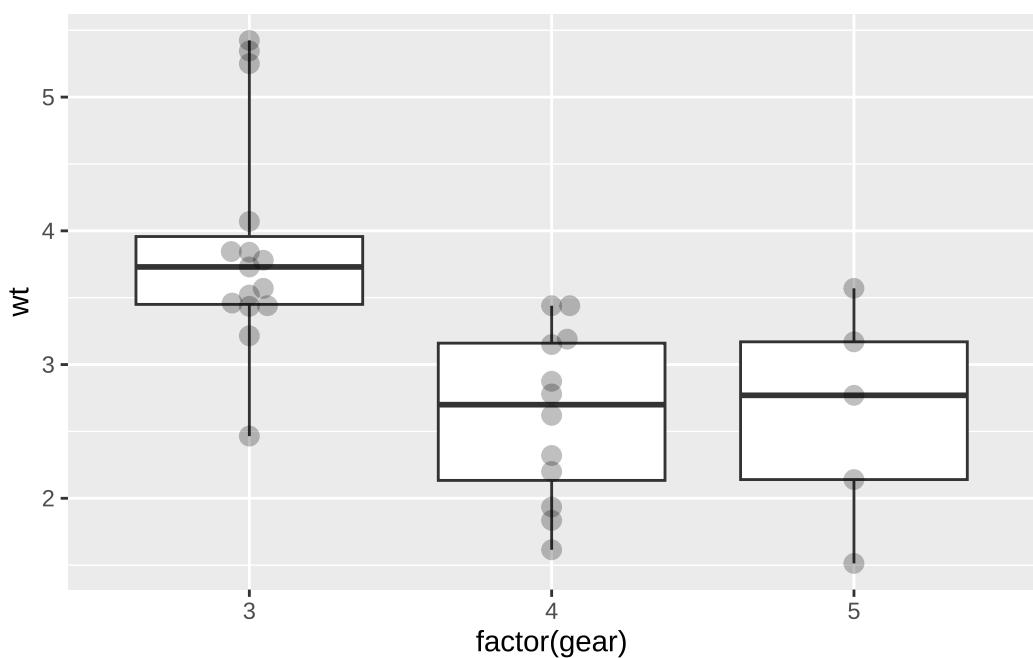

```
ggplot(mtcars,aes(x = factor(gear),y = wt))+  
  geom_boxplot(coef=3)+  
  geom_dotplot(alpha=.7, # group similar(ish) data on a line  
               binaxis = "y",stackdir = "center",  
               stackratio = .9,dotsize = .6)
```

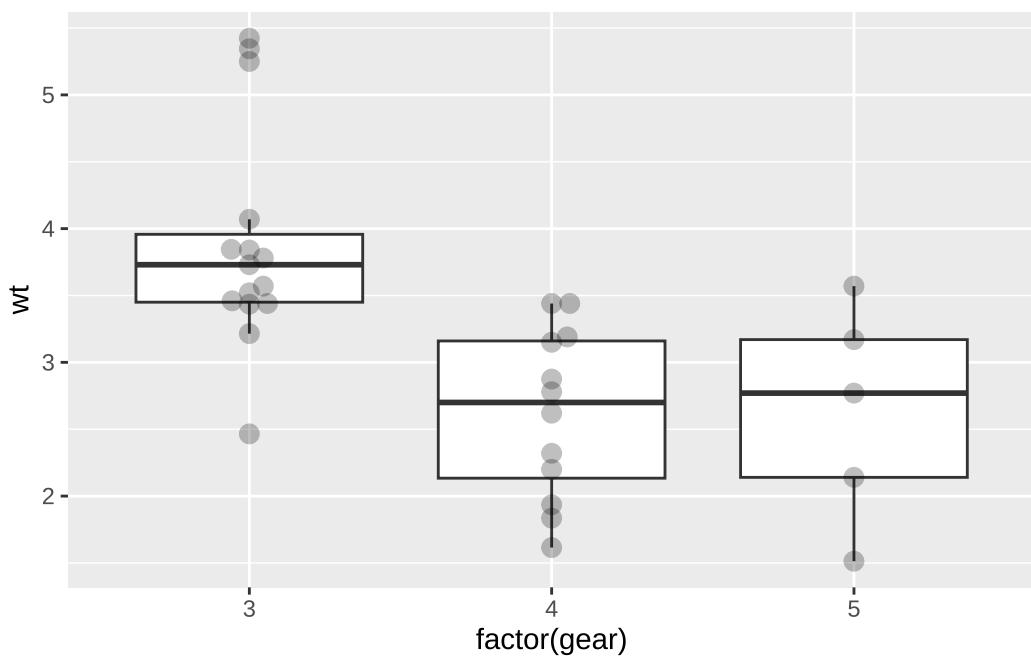

Bin width defaults to 1/30 of the range of the data. Pick better value with `binwidth`.

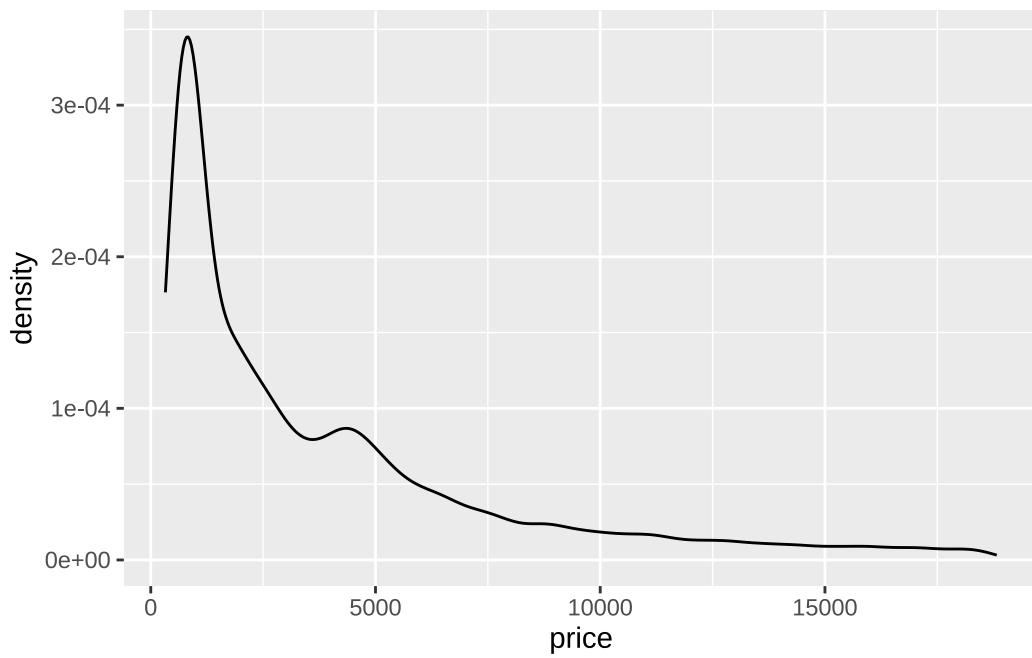

```
ggplot(mtcars,aes(x = factor(gear),y = wt))+  
  geom_boxplot(coef=3)+  
  ggbeeswarm::geom_beeswarm(cex = 2,size=3,alpha=.25)
```

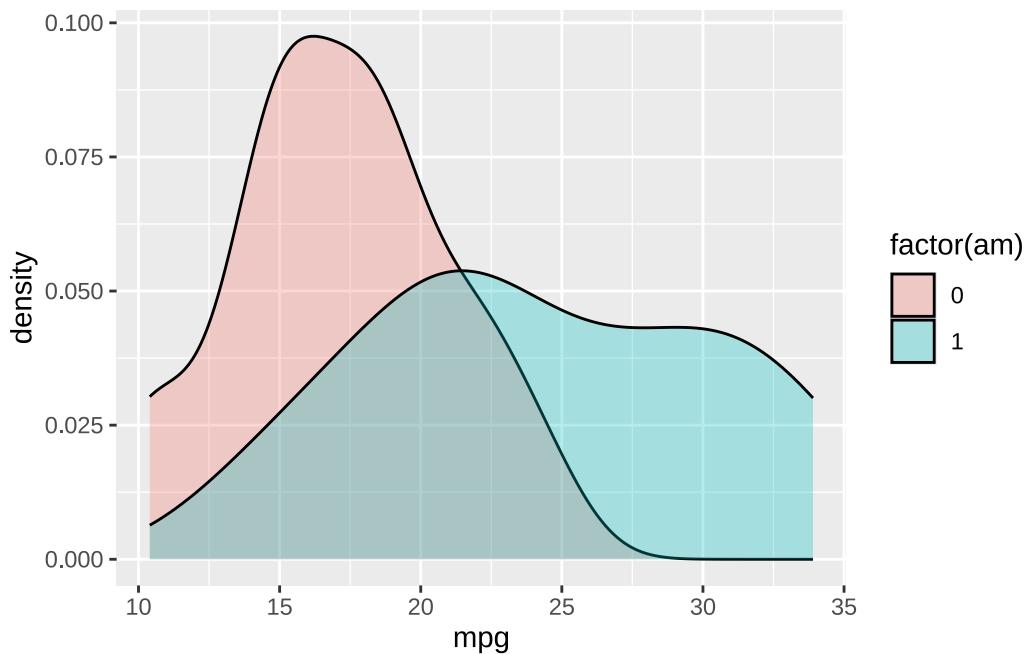

```
ggplot(mtcars,aes(x = factor(gear),y = wt))+  
  geom_boxplot(outlier.alpha = 0)+ # to avoid plotting outliers twice  
  geom_beeswarm(cex = 2,size=3,alpha=.25)
```

```
#density plot  
ggplot(diamonds,aes(price))+  
  geom_density()
```

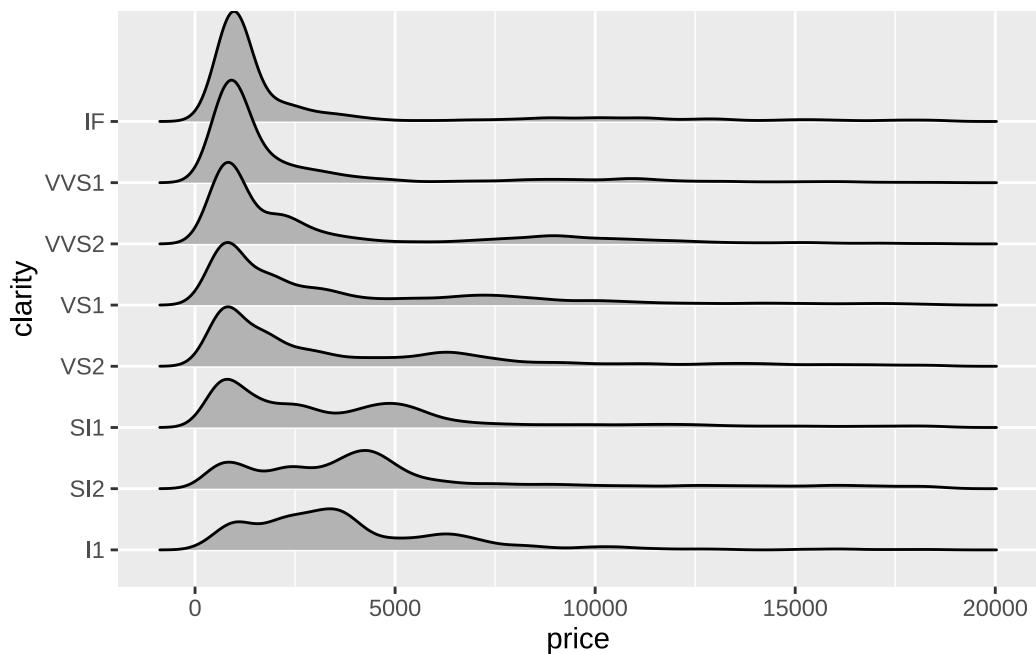

```
ggplot(mtcars,aes(mpg, fill=factor(am)))+  
  geom_density(alpha=.3)
```

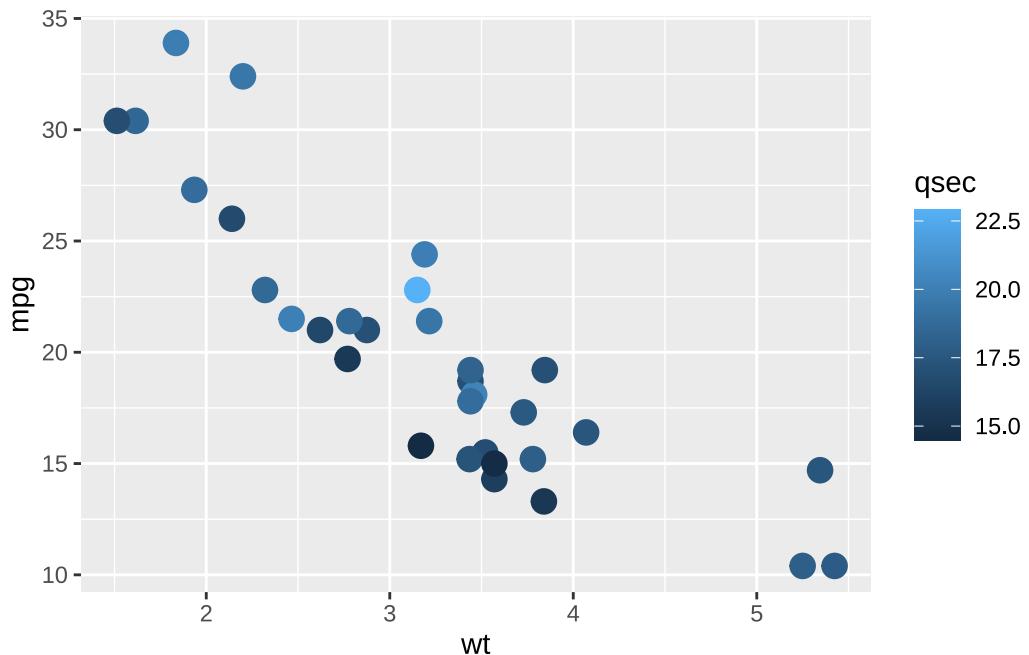

```
ggplot(diamonds,aes(price,y=clarity))+  
  geom_density_ridges()
```

Picking joint bandwidth of 403

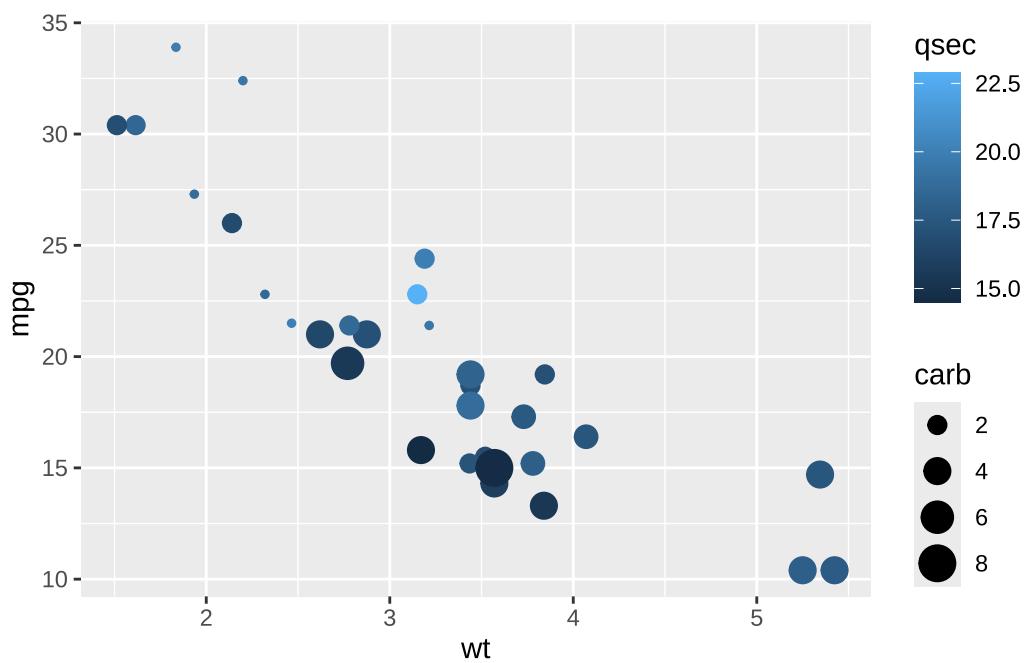

7.7 Combining and finetuning aesthetics

```
ggplot(data=mtcars,aes(wt, mpg,color=qsec))+  
  geom_point(size=4) #outside aes!
```

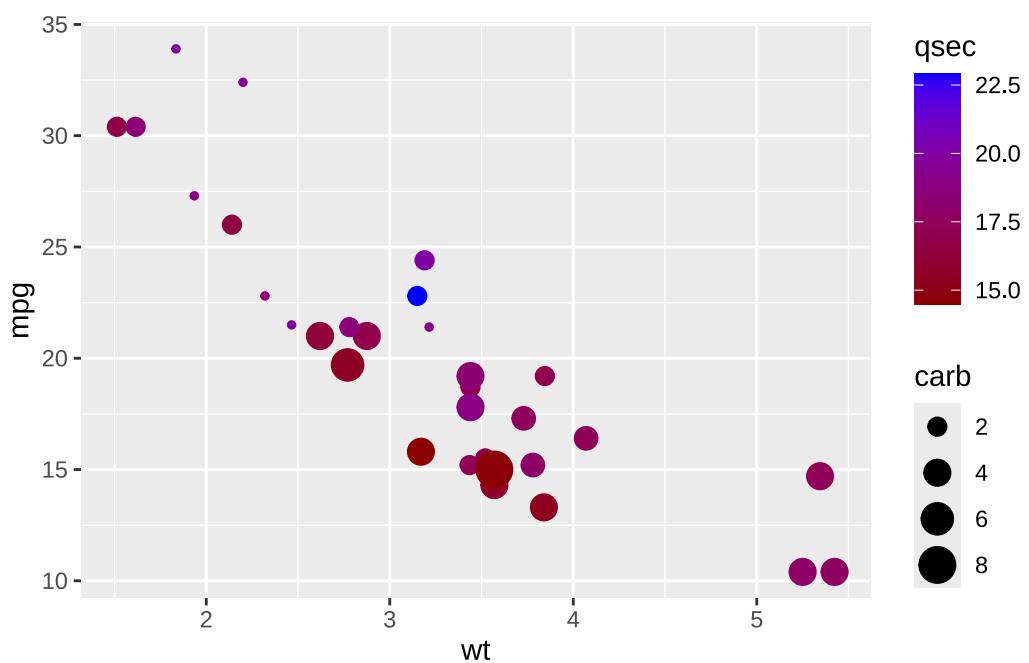

```
ggplot(data=mtcars,aes(wt, mpg,color=qsec, size=carb))+  
  geom_point()
```

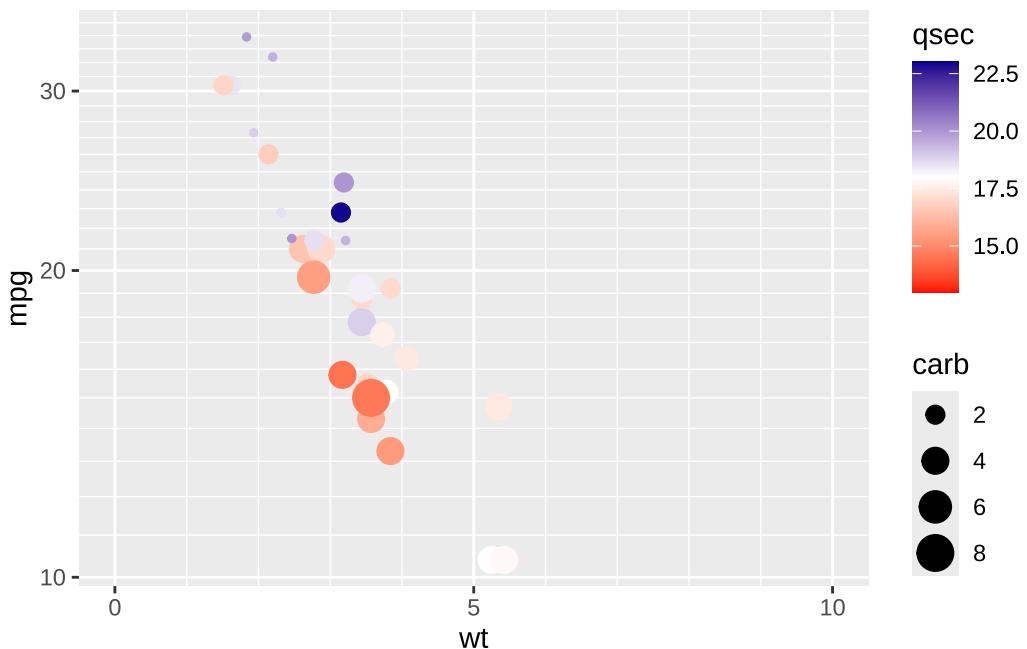

```
ggplot(data=mtcars,aes(wt, mpg,color=qsec, size=carb))+  
  scale_color_gradient(low="darkred",high="blue")+
```

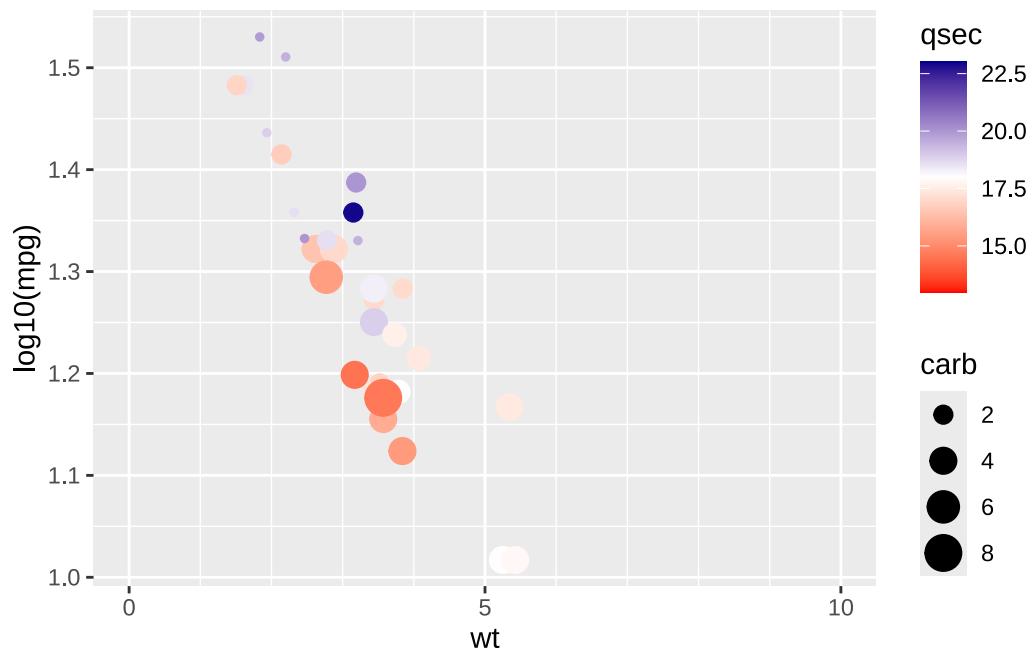

```
geom_point()
```

```
ggplot(data=mtcars,aes(wt, mpg,color=qsec, size=carb))+  
  scale_color_gradient2(low="red",high="darkblue",  
                        mid="white",  
                        limits=c(13,23),midpoint=18)+  
  geom_point()+  
  scale_x_continuous(breaks = seq(0,100,5),  
                     minor_breaks=seq(0,100,1),  
                     limits = c(0,10))+  
  scale_y_log10(minor_breaks=seq(0,100,1))
```

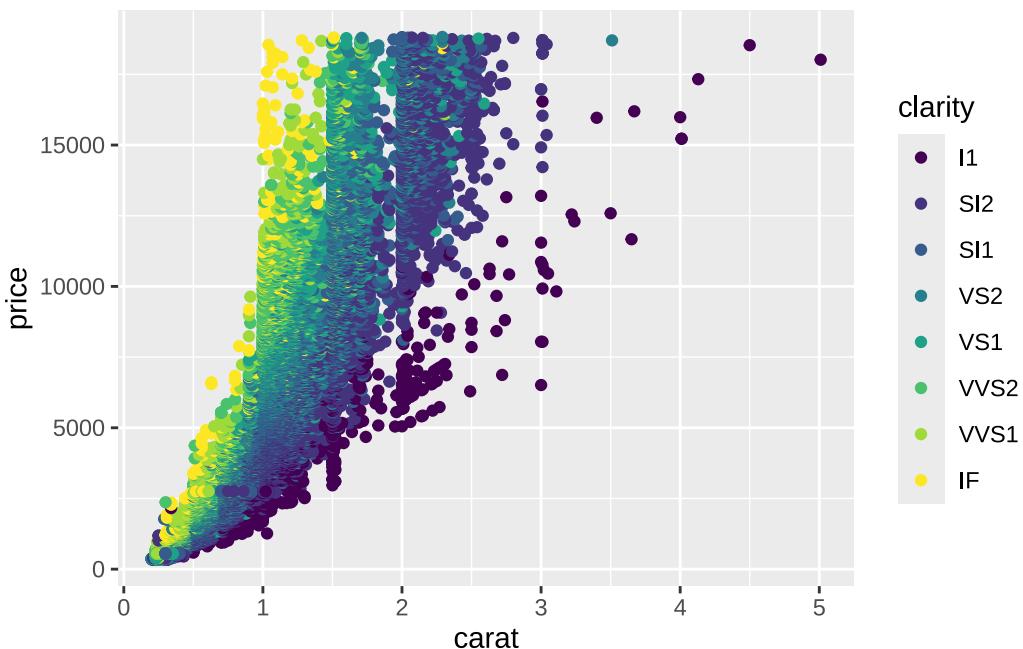

```
ggplot(data=mtcars,aes(wt, log10(mpg),color=qsec, size=carb))+  
  scale_color_gradient2(low="red",high="darkblue",  
                        mid="white",  
                        limits=c(13,23),midpoint=18)+  
  geom_point() +  
  scale_x_continuous(breaks = seq(0,100,5),  
                     minor_breaks=seq(0,100,1),  
                     limits = c(0,10))#+
```

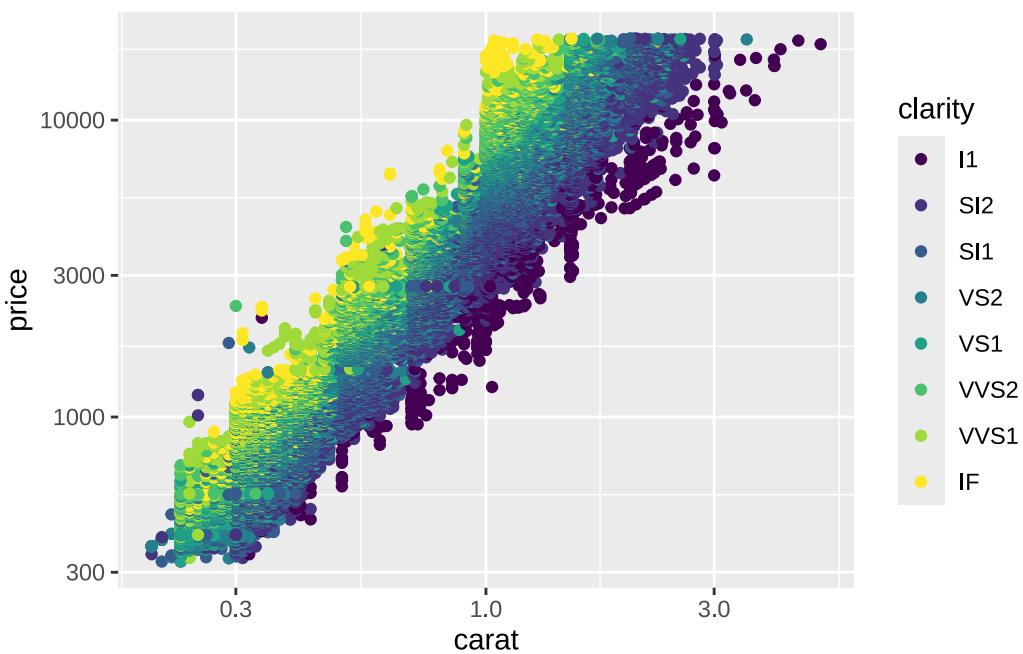

```
# scale_y_log10(minor_breaks=seq(0,100,1))

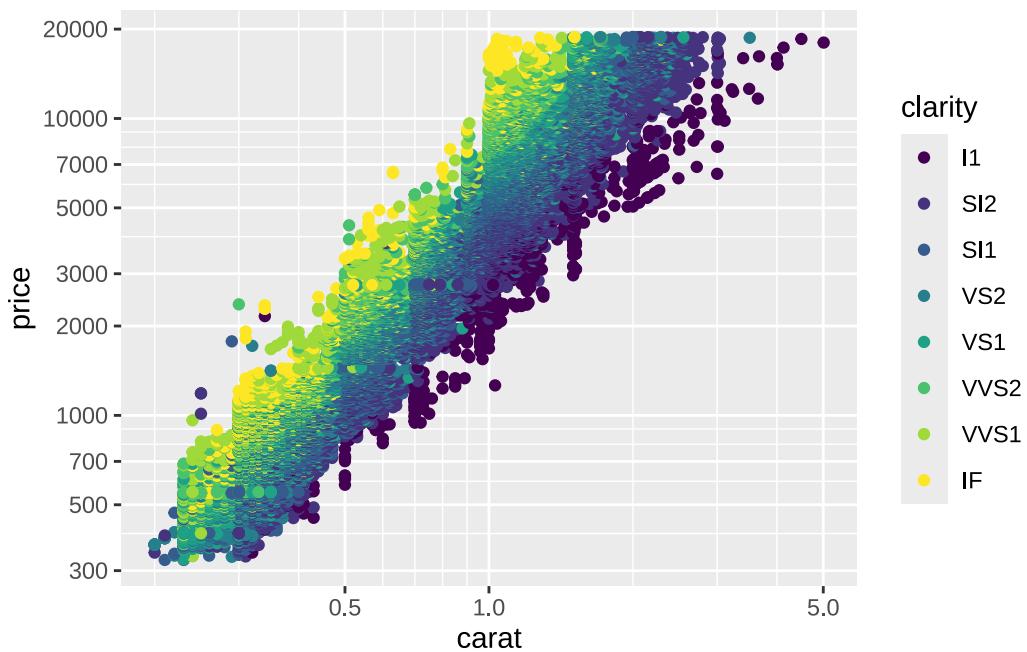

ggplot(diamonds,aes(carat,price,color=clarity))+
  geom_point()
```

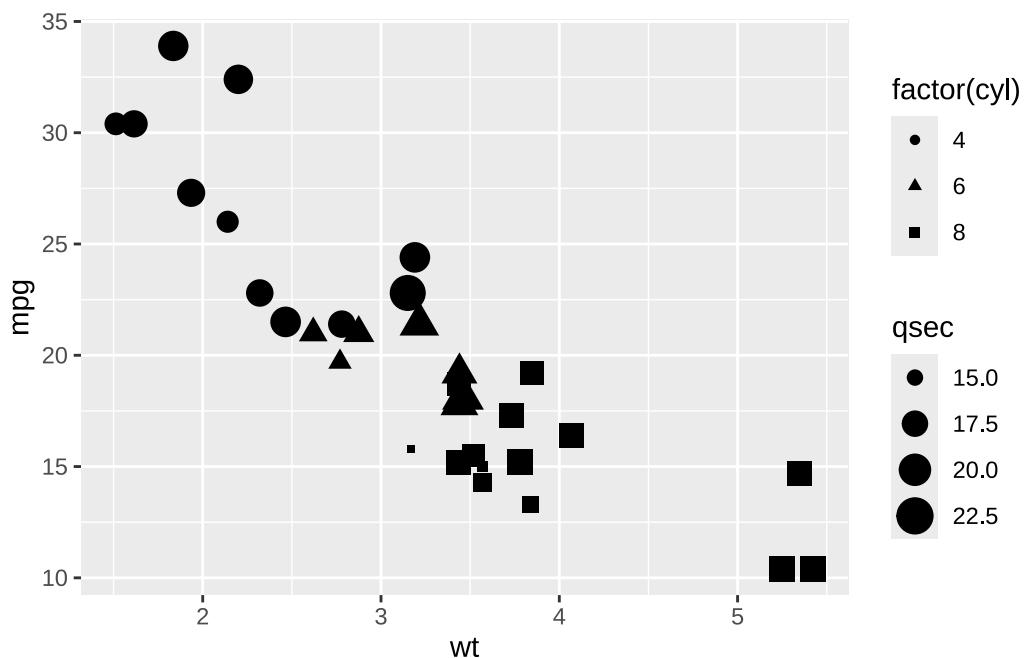

```
ggplot(diamonds,aes(carat,price,color=clarity))+  
  geom_point() +  
  scale_x_log10() +  
  scale_y_log10()
```

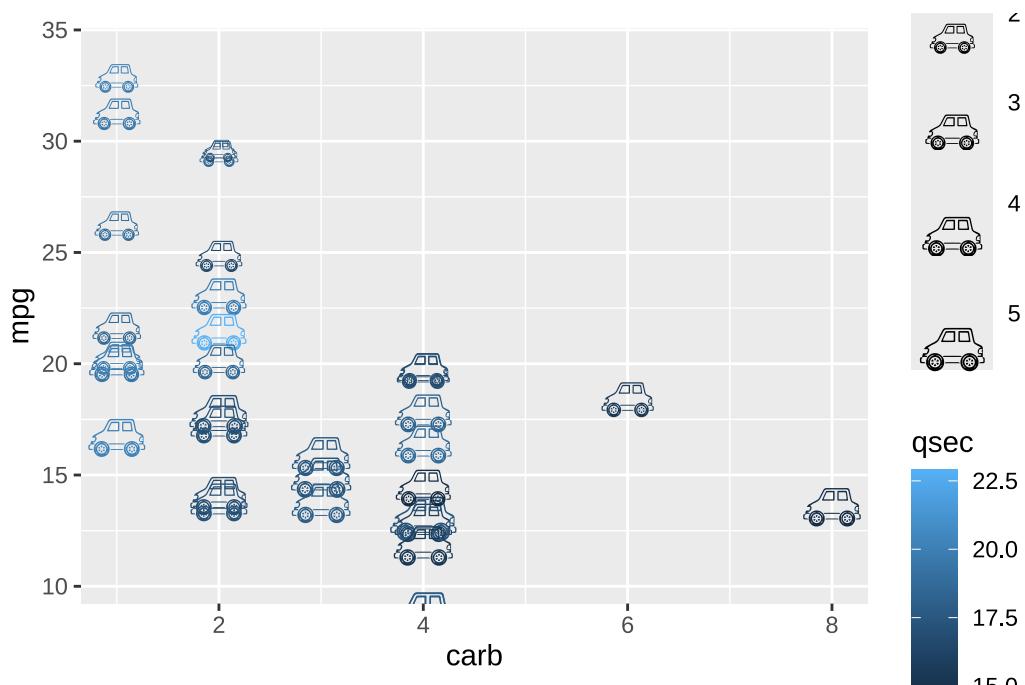

```
ggplot(diamonds,aes(carat,price,color=clarity))+  
  geom_point() +  
  scale_x_log10(  
    breaks=logrange_15,  
    minor_breaks=logrange_123456789) +  
  scale_y_log10(  
    breaks=logrange_12357,  
    minor_breaks=logrange_123456789)
```

```
# use different aesthetic mappings  
ggplot(data=mtcars,  
        aes(wt, mpg, size=qsec, shape=factor(cyl)))+  
  geom_point()
```

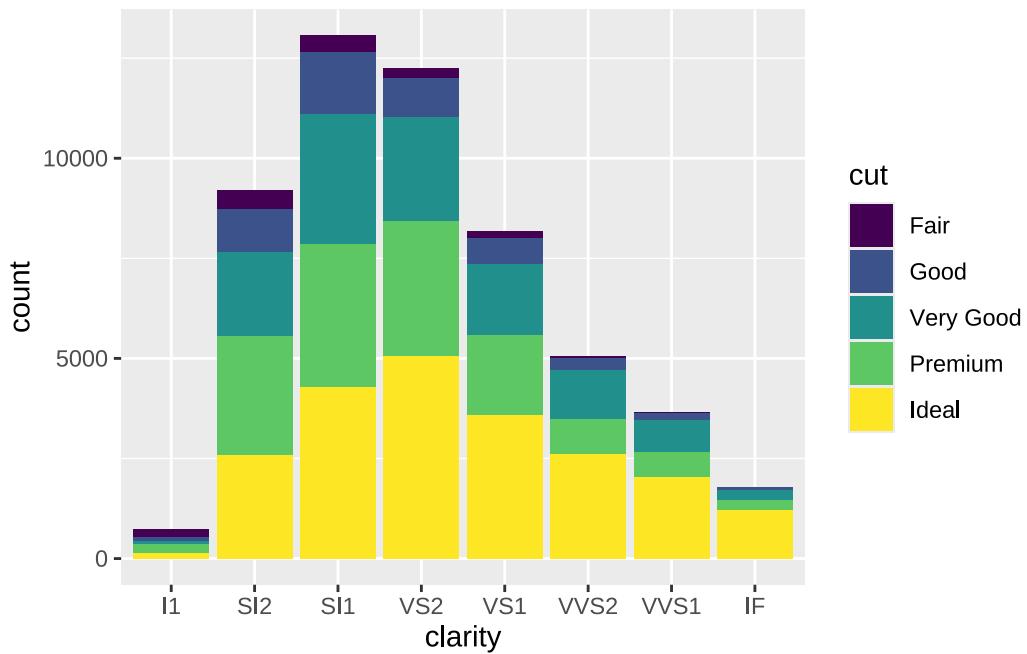

```
ggplot(data=mtcars,aes(carb, mpg,color=qsec, size=wt))+  
  geom_text(family="EmojiOne",label="\U1F697") +  
  scale_size_continuous(range = c(5,10))
```

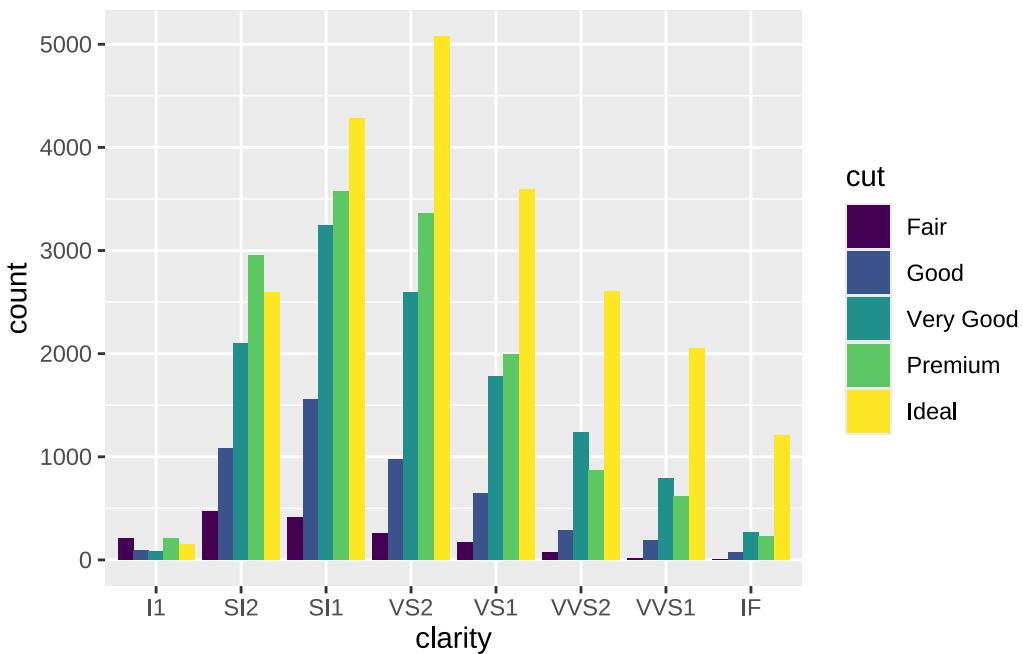

7.8 Positioning elements

The position arguments allows stacking, dodging, jittering and exact positioning of elements. Positioning is an essential part of storytelling, the same data can be presented with different focus.

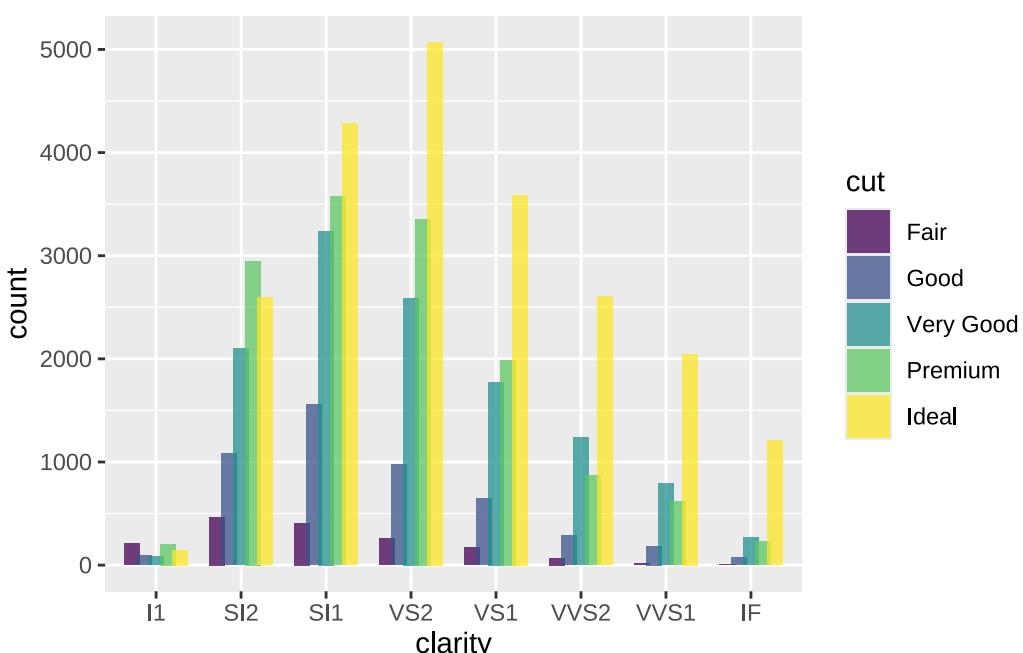

```
p<-ggplot(data=diamonds,aes(clarity,fill=cut))  
p+geom_bar(position="stack") # default for bar
```

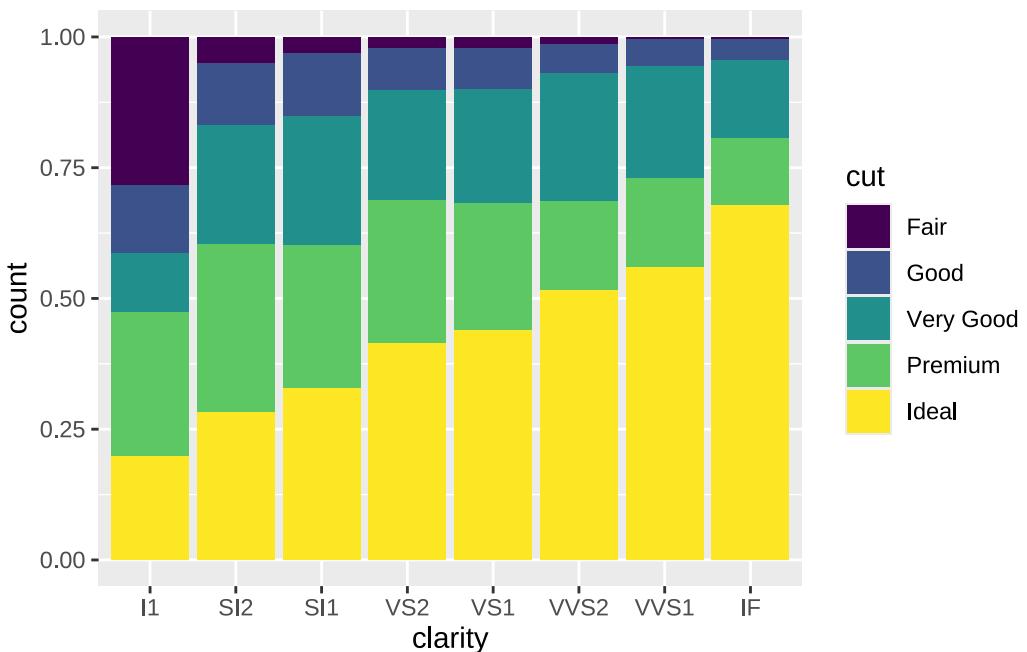

```
p+geom_bar(position="dodge")
```

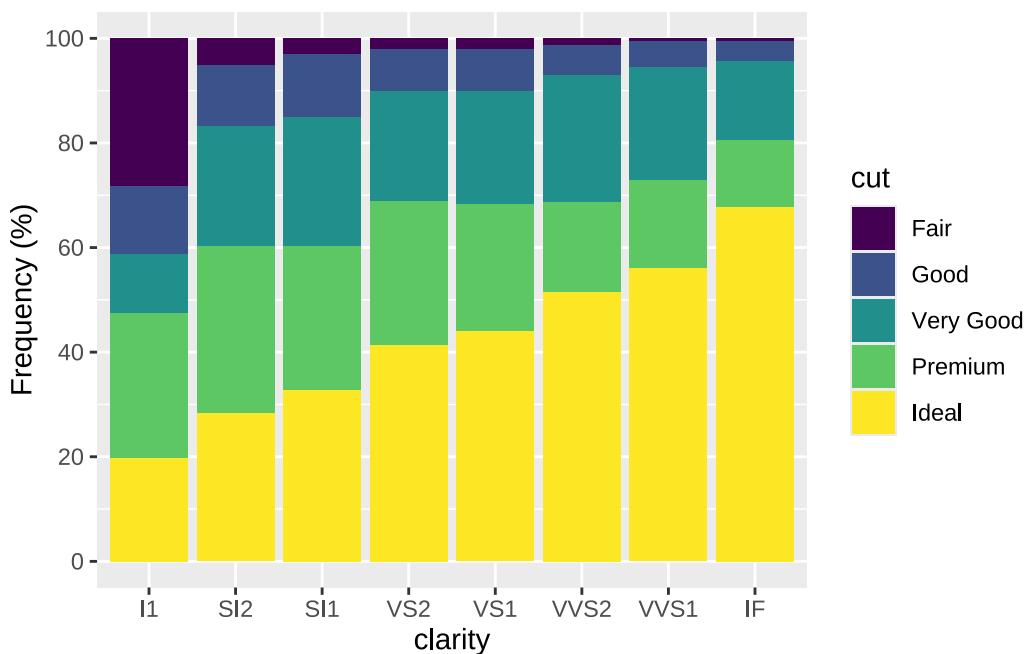

```
p+geom_bar(position=position_dodge(width = 0.7), alpha=.75)
```

```
p+geom_bar(position="fill") #y-axis labeling needs tuning
```

```
p+geom_bar(position="fill")+
  scale_y_continuous(name = "Frequency (%)",
                     breaks=seq(0,1,.2), #steps
                     labels=seq(0,100,20))
```

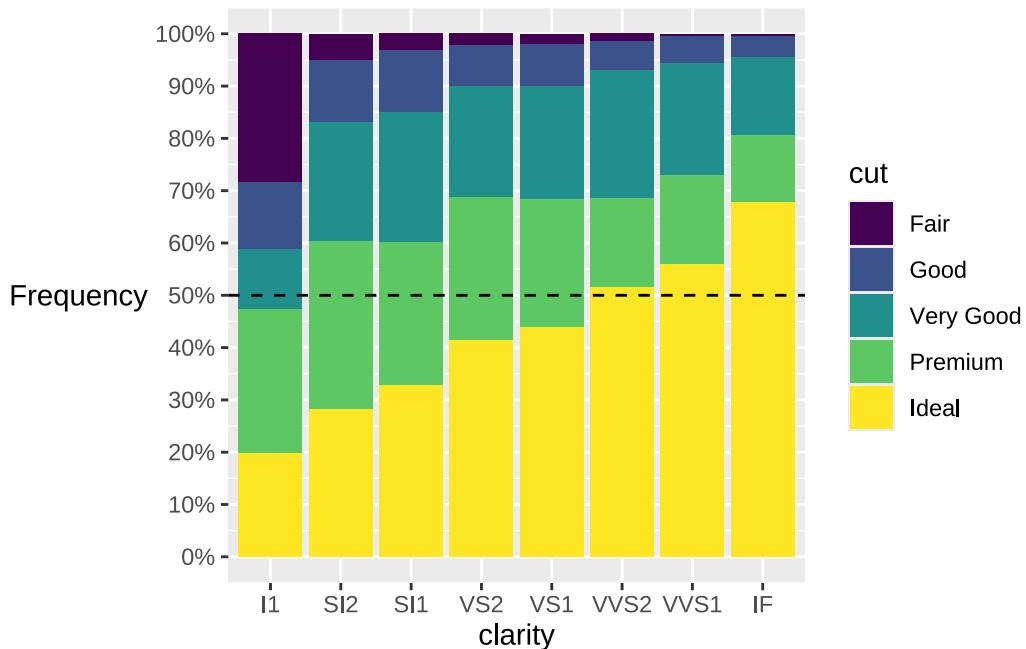

```

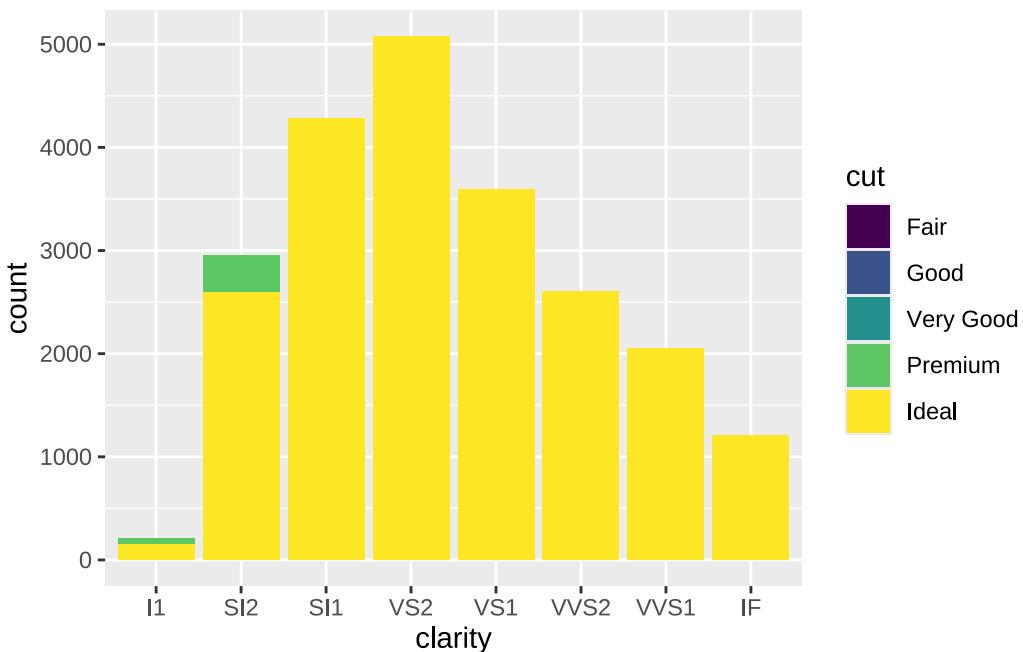

p+geom_bar(position="fill")+
  scale_y_continuous("Frequency",
                     breaks=seq(0,1,.1),
                     labels=scales::percent)+
  theme(axis.title.y = element_text(angle = 0,
                                    vjust = .5))+  

  geom_hline(yintercept = .5, linetype=2) # e.g. for reference lines

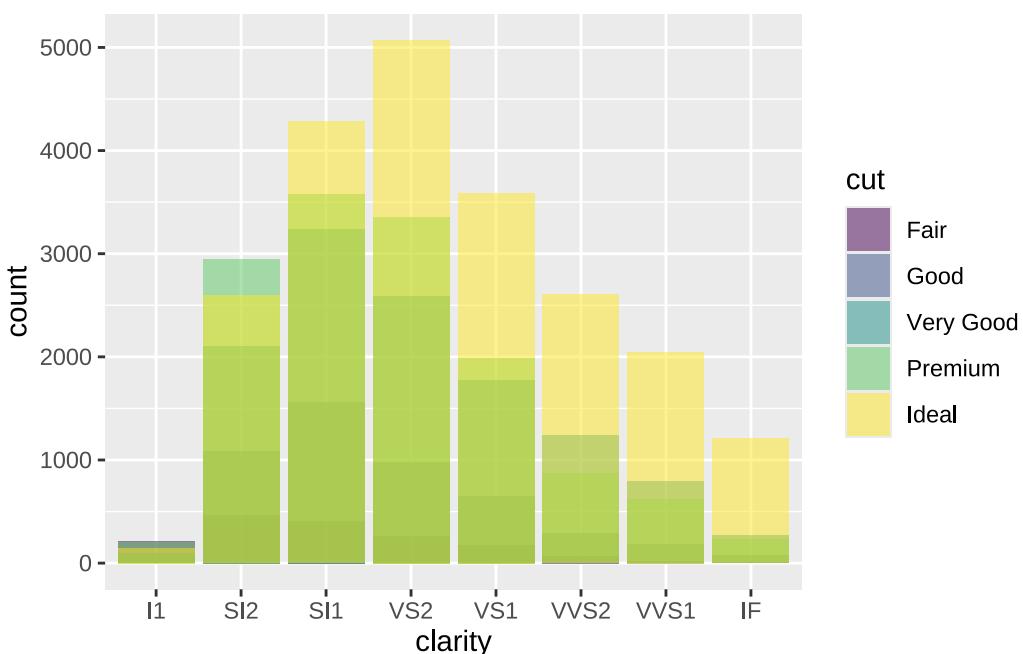

```

```
p+geom_bar(position="identity") # bad idea!
```

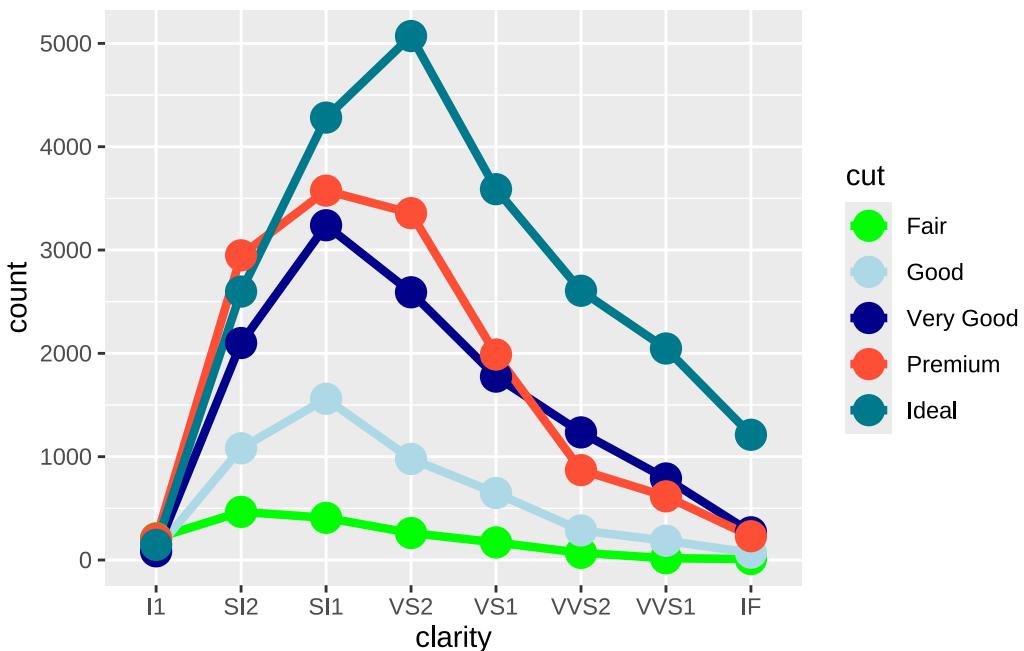

```
p+geom_bar(position="identity",alpha=.5) # even worse!!
```

```
ggplot(data=diamonds,aes(clarity,color=cut, group=cut))+  
  geom_freqpoly(stat="count",position="identity",lwd=1.5)+  
  geom_point(stat="count",size=5)+
```

```
scale_color_manual(values = c("green","lightblue",
                             "darkblue",
                             "rgb(253,79,54,maxColorValue = 255),
                             "#00798d"))
```

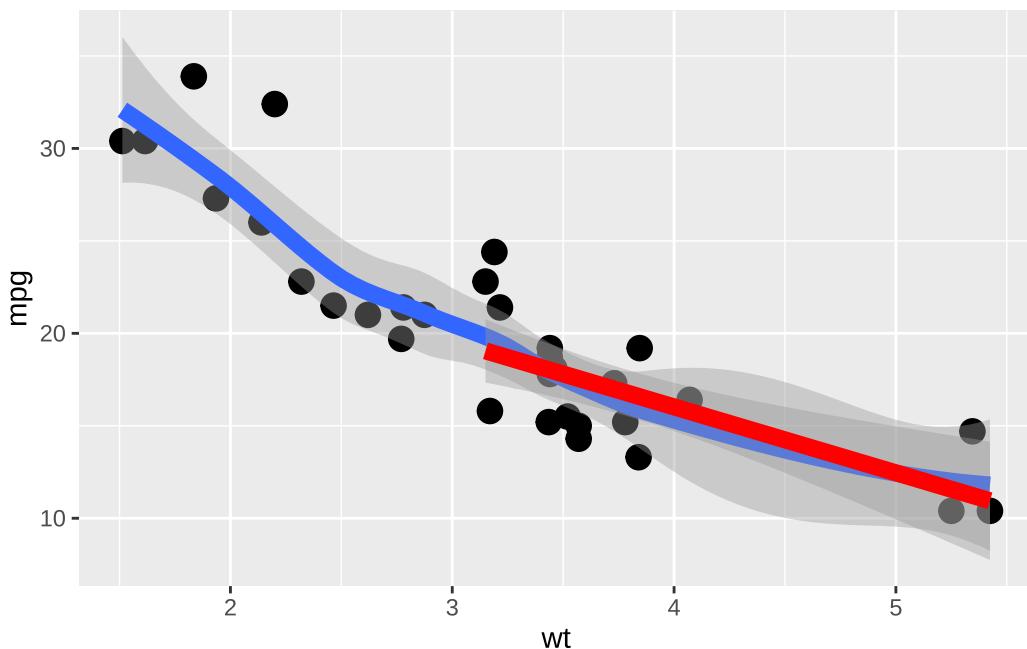

7.9 Order of layers

When combining various geoms, the order is important, as elements are not transparent by default.

```
ggplot(data=mtcars,aes(wt, mpg))+  
  geom_point(size=4)+  
  geom_smooth(size=3)+ # line overlaps points  
  geom_smooth(data=mtcars |> filter(wt>3), #picks a sub-sample  
              method="lm", linewidth=3, color="red")
```

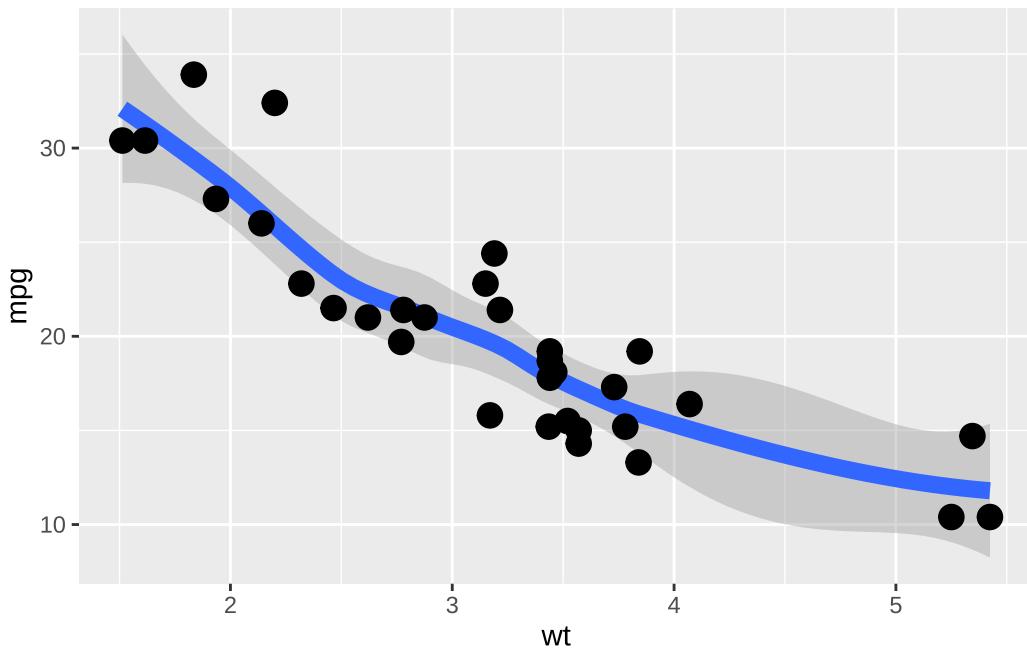

Warning: Using `size` aesthetic for lines was deprecated in ggplot2 3.4.0.
i Please use `linewidth` instead.

`geom_smooth()` using method = 'loess' and formula = 'y ~ x'
`geom_smooth()` using formula = 'y ~ x'

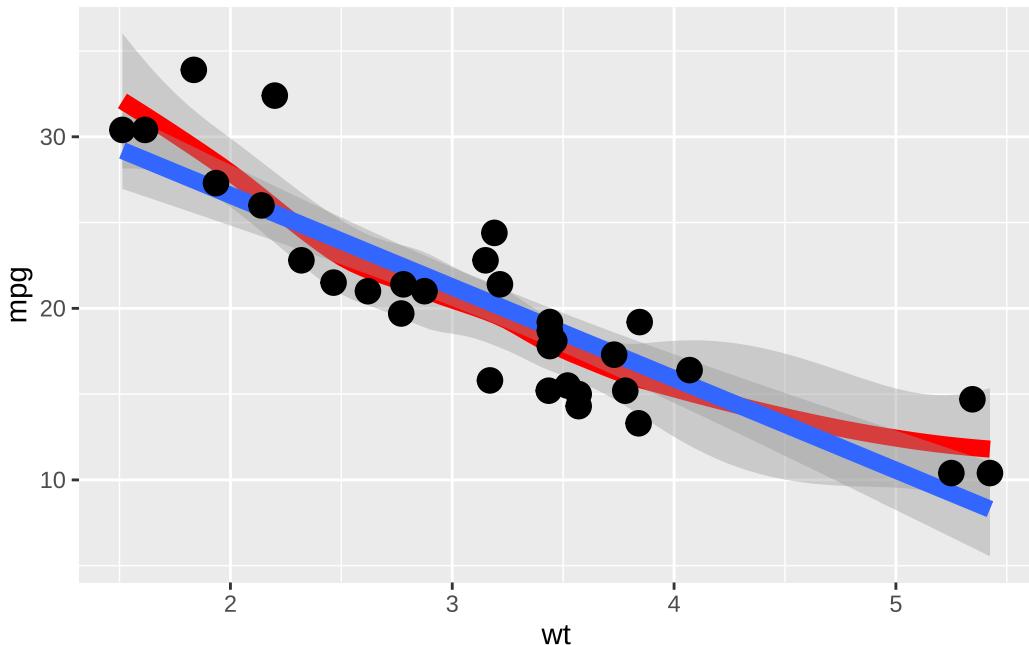

```
ggplot(data=mtcars,aes(wt, mpg))+  
  geom_smooth(linewidth=3)+  
  geom_point(size=4)
```

```
`geom_smooth()` using method = 'loess' and formula = 'y ~ x'
```

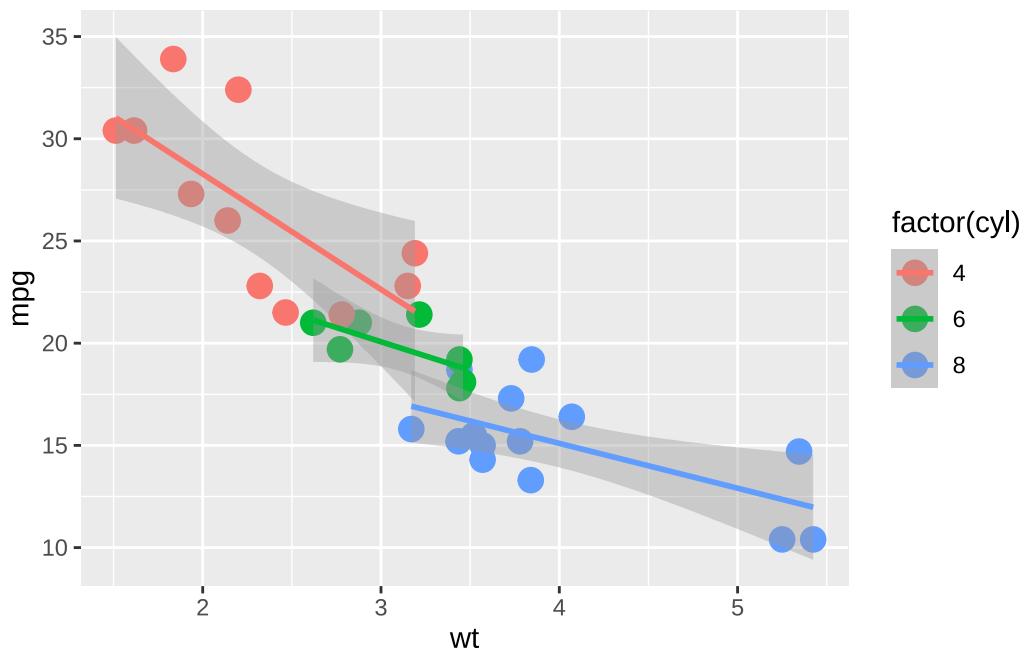

```
ggplot(data=mtcars,aes(wt, mpg))+  
  geom_smooth(linewidth=3,color="red") +  
  geom_smooth(method="lm", linewidth=3) +  
  geom_point(size=4)
```

```
`geom_smooth()` using method = 'loess' and formula = 'y ~ x'  
`geom_smooth()` using formula = 'y ~ x'
```

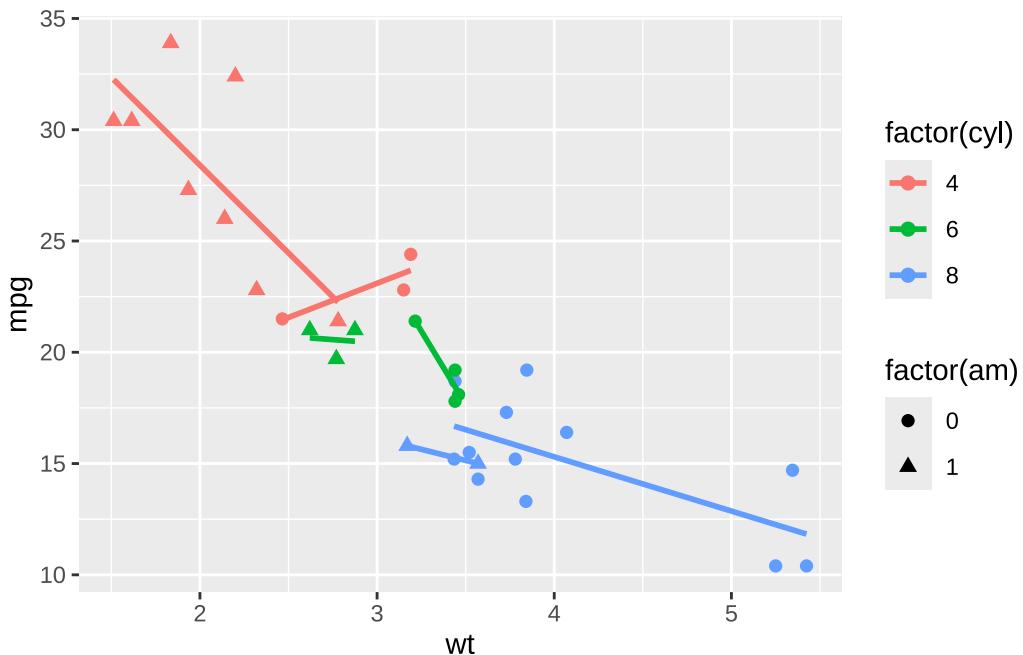

```
ggplot(data=mtcars,aes(wt, mpg,  
                      color=factor(cyl)))+  
  geom_point(size=4)+  
  geom_smooth(method="lm", linewidth=1)
```

```
`geom_smooth()` using formula = 'y ~ x'
```

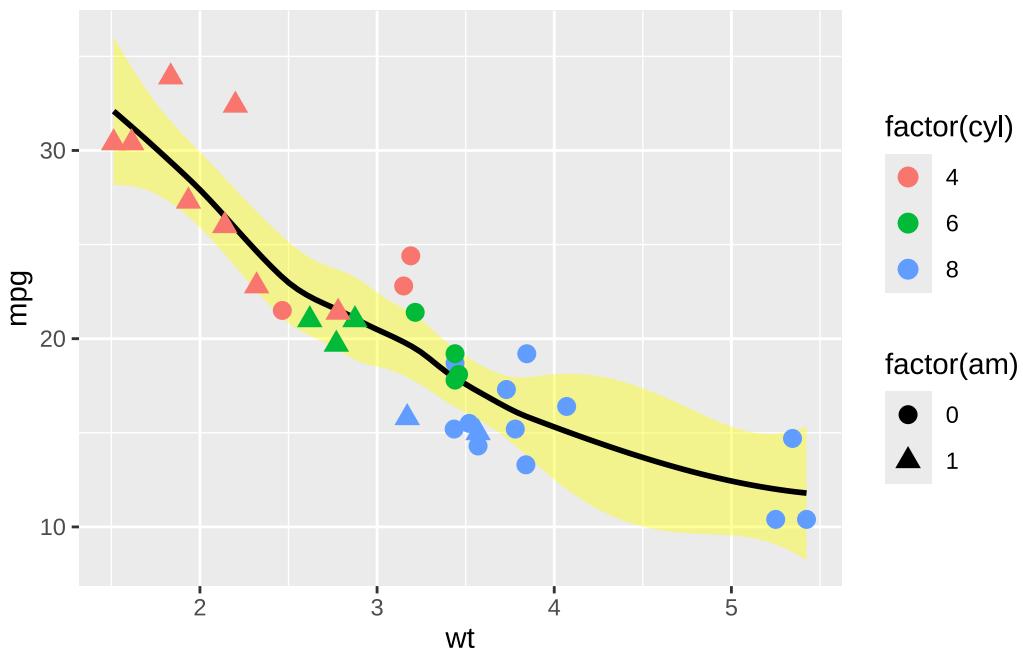

```
ggplot(data=mtcars,aes(wt, mpg,
                        color=factor(cyl),
                        shape=factor(am)))+
  geom_point(size=2)+
  geom_smooth(method="lm", linewidth=1, se=FALSE)
`geom_smooth()` using formula = 'y ~ x'
```

7.10 Local aesthetics for layers

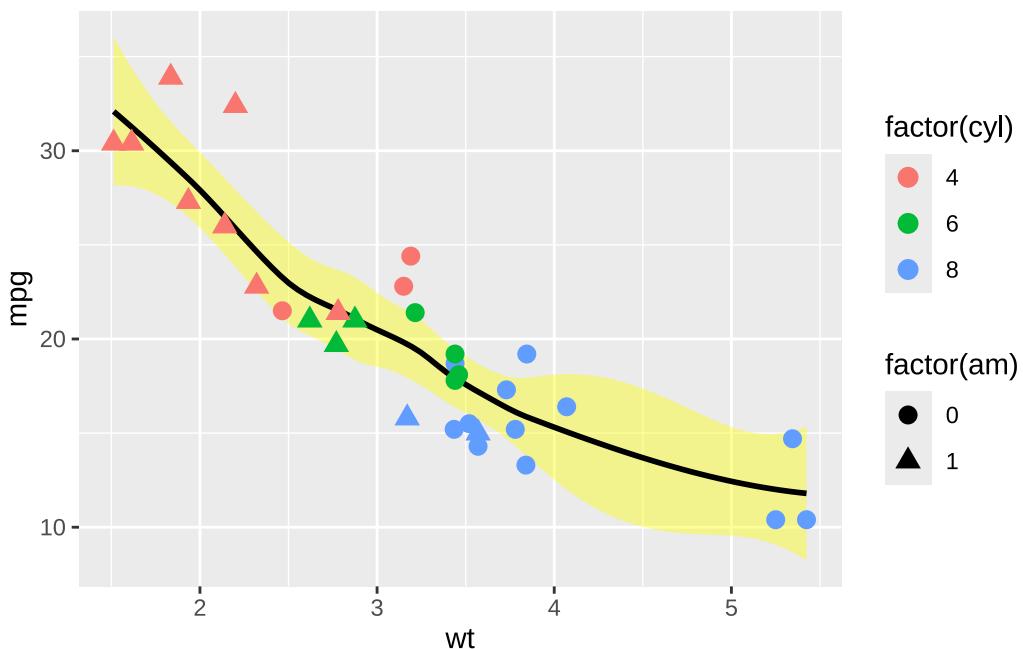

```
#? lm for all?
ggplot(data=mtcars,aes(wt, mpg))+
  geom_smooth(size=1,color="black",fill="yellow")+
  geom_point(size=3,aes(color=factor(cyl),shape=factor(am))) #aes for geom only

`geom_smooth()` using method = 'loess' and formula = 'y ~ x'
```

```
ggplot(data=mtcars,aes(wt, mpg,color=factor(cyl)))+
  geom_smooth(size=1,color="black",fill="yellow")+ # global color overwritten
  geom_point(size=3, aes(shape=factor(am)))
```

`geom_smooth()` using method = 'loess' and formula = 'y ~ x'

7.11 Faceting (splitting) plots

Visualizing many groups can lead to confusing / too-busy plots, splitting is often an alternative. Visualizing many variables at the same time can be achieved with facets as well (after pivot_longer).

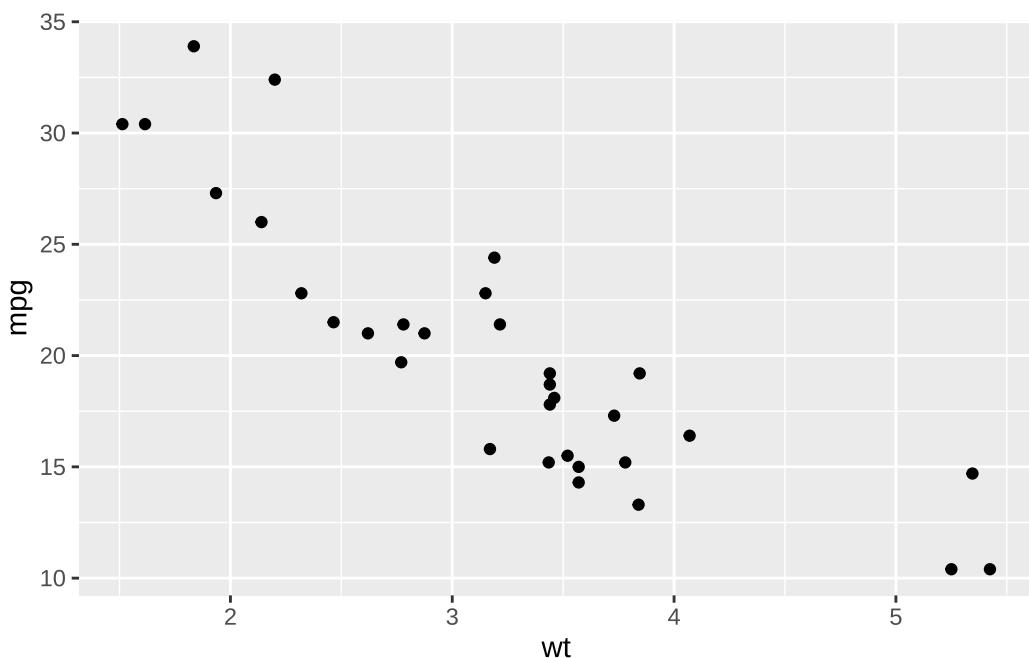

7.11.1 facet_grid

Grids are specified by defining variables for rows and/or columns, empty combinations still are shown.

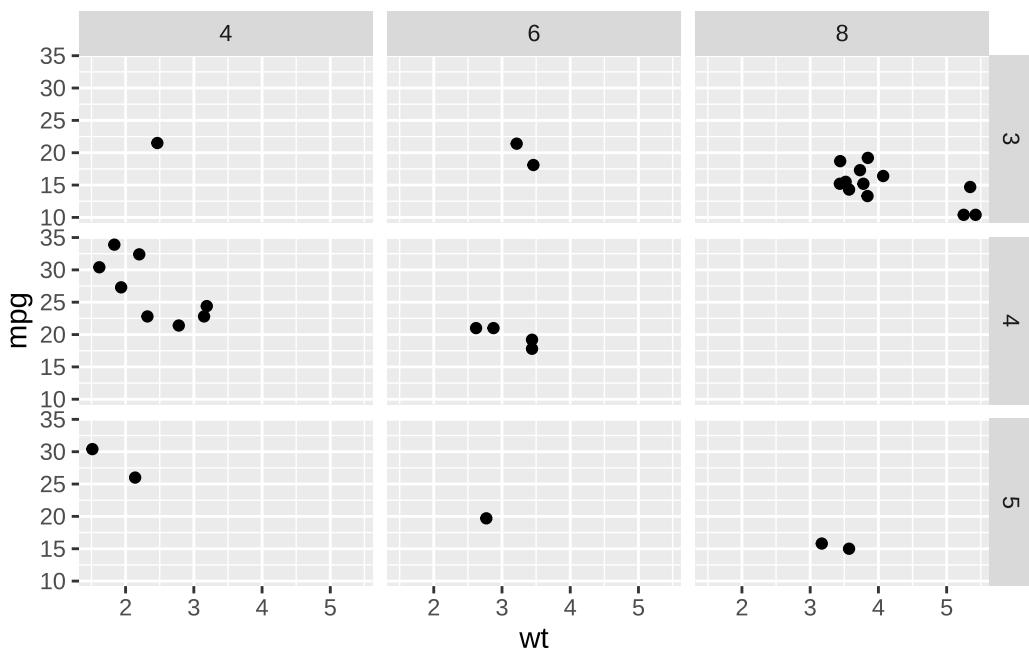

Labeling of facets often requires name and content to be informative.

Margins (taking all elements together) can be shown for rows and/or columns.

```
(p.tmp <- ggplot(mtcars, aes(wt, mpg)) +  
  geom_point())
```

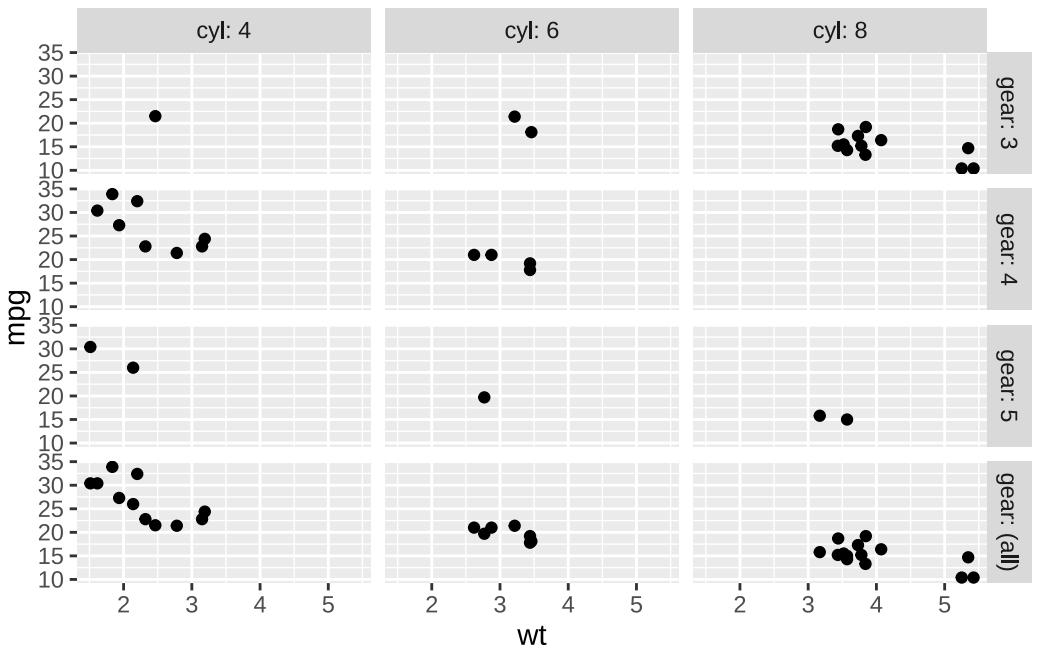

```
p.tmp + facet_grid(rows = vars(gear),  
                    cols = vars(cyl))
```

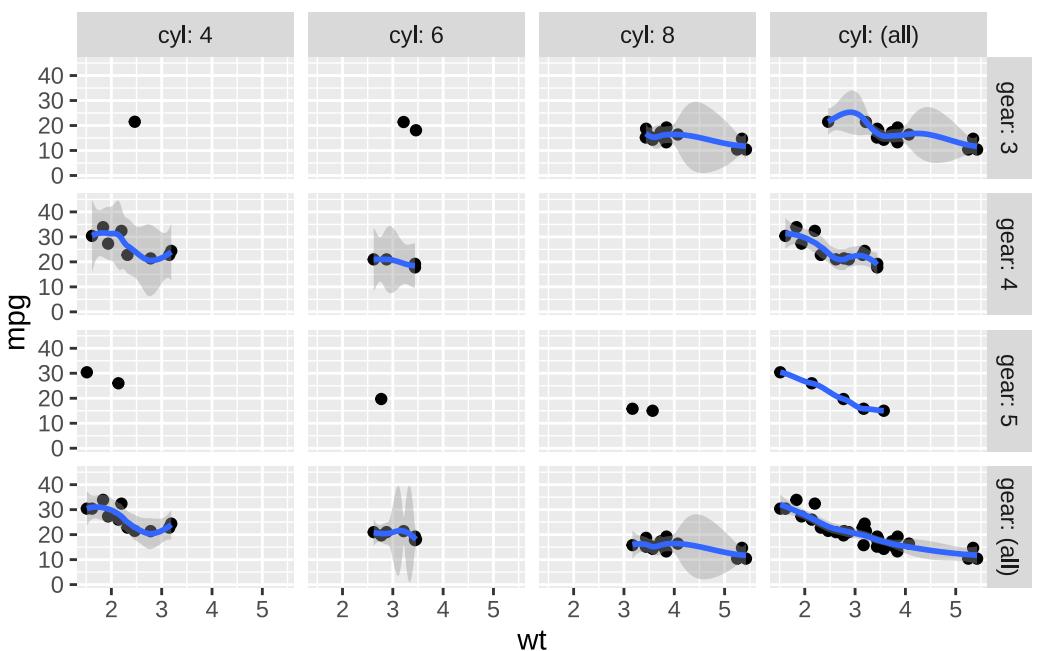

```
cat("facet labeling improved:\n")
```

facet labeling improved:

```
p.tmp + facet_grid(rows = vars(gear),  
                    cols = vars(cyl),  
                    labeller=label_both,margins="gear")
```

```
# options(warn=-1)
p.tmp + geom_smooth() +
  facet_grid(rows = vars(gear),
             cols = vars(cyl),
             labeller=label_both, margins=TRUE)
```

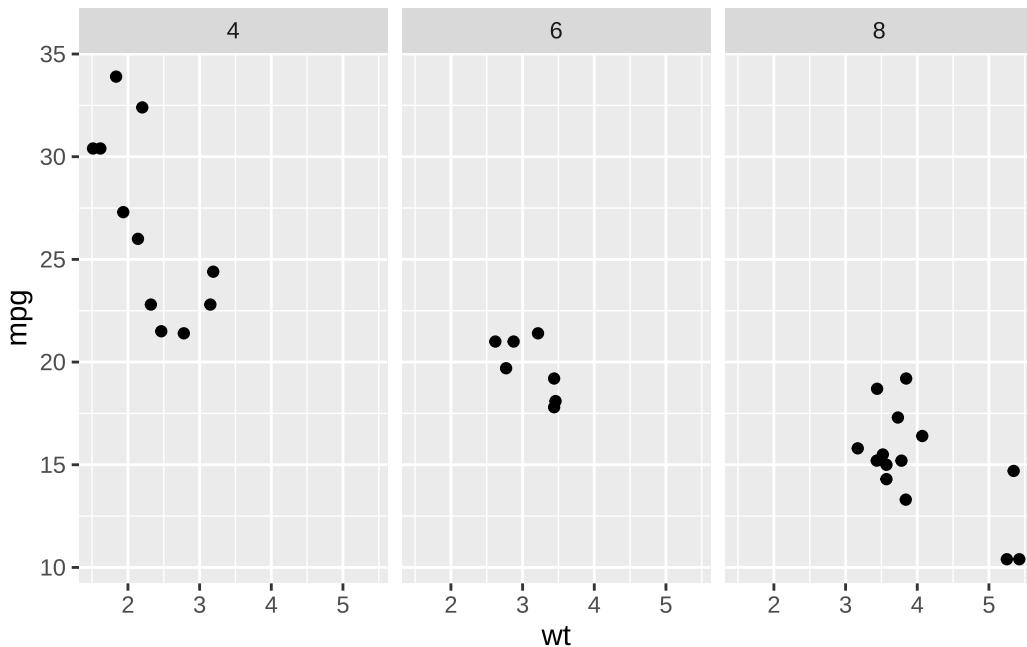

```
# options(warn=0)
```

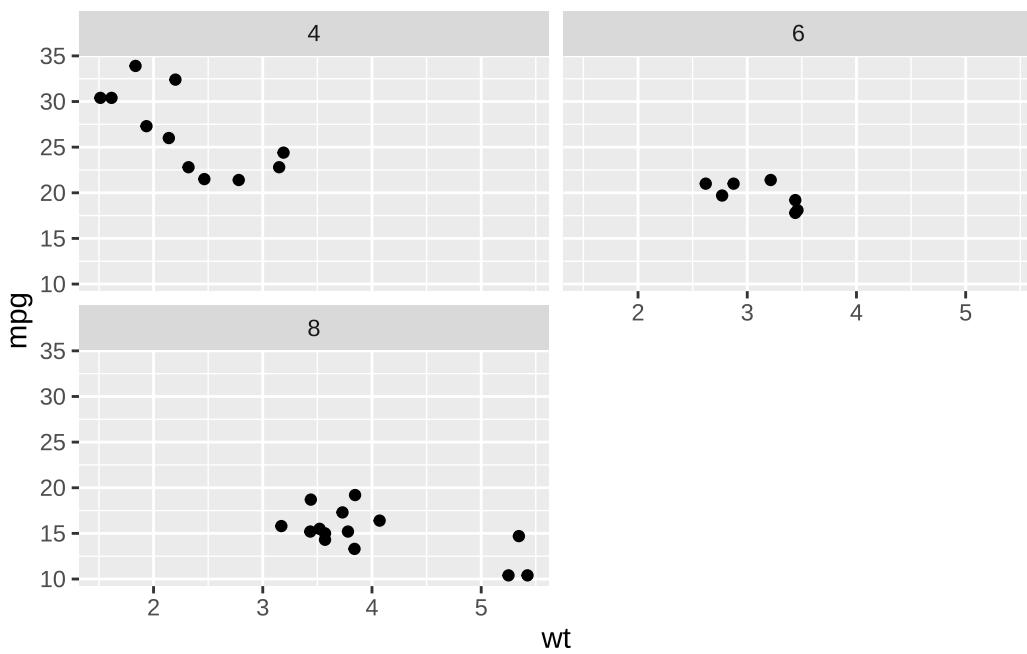

7.11.2 facet_wrap

When showing many facets, wrapping around after some is useful, less systematic than grid.

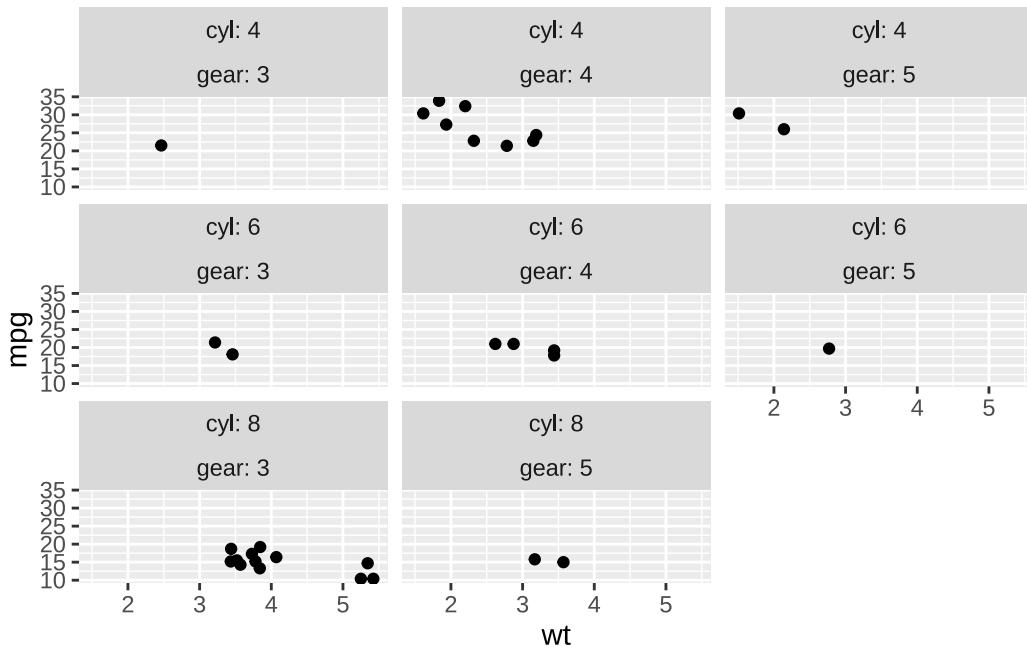

```
p.tmp + facet_wrap(facets = vars(cyl))
```

```
p.tmp + facet_wrap(facets = vars(cyl), ncol=2)
```

```
# empty combination is dropped
p.tmp + facet_wrap(facets=vars(cyl,gear), labeller=label_both)
```

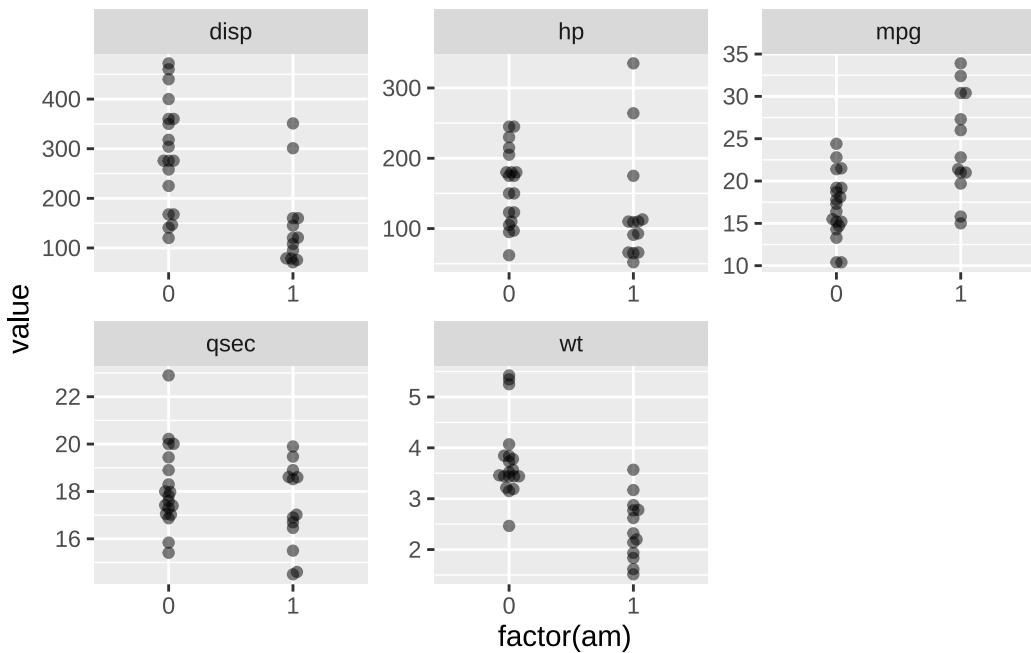

```
#combining variables
mtcars |>
```

```

pivot_longer(cols = c(wt, mpg, hp, disp, qsec)) |> #view()
ggplot(aes(x=factor(am), y=value))+ 
  geom_beeswarm(alpha=.5, cex=2)+ 
  facet_wrap(facets = vars(name), scales="free")

```

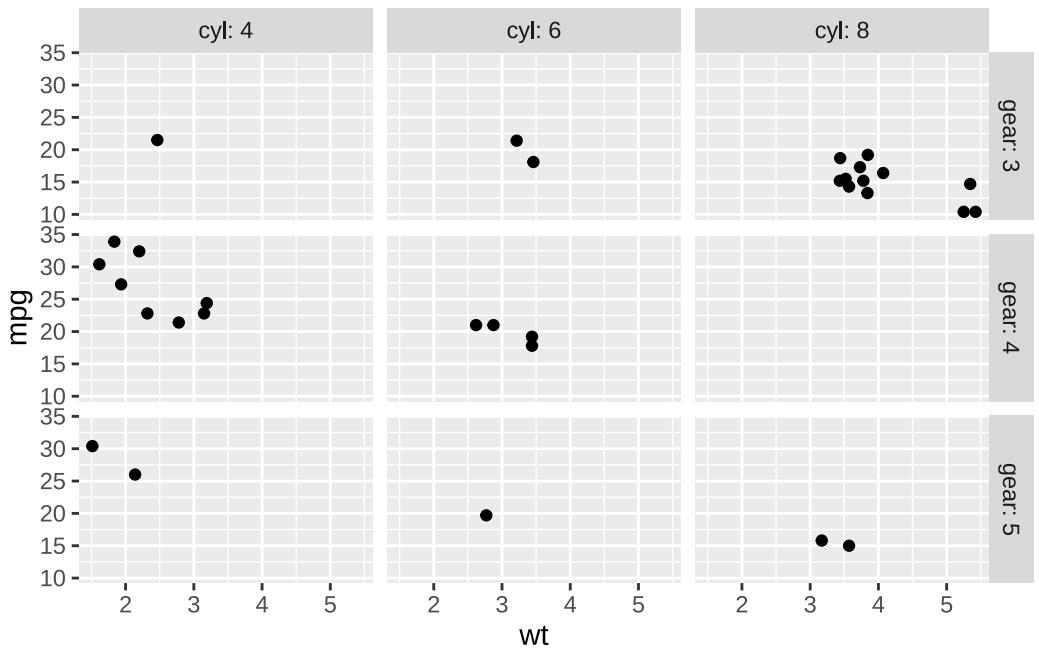

7.11.3 Controlling scales in facets (default: scales="fixed")

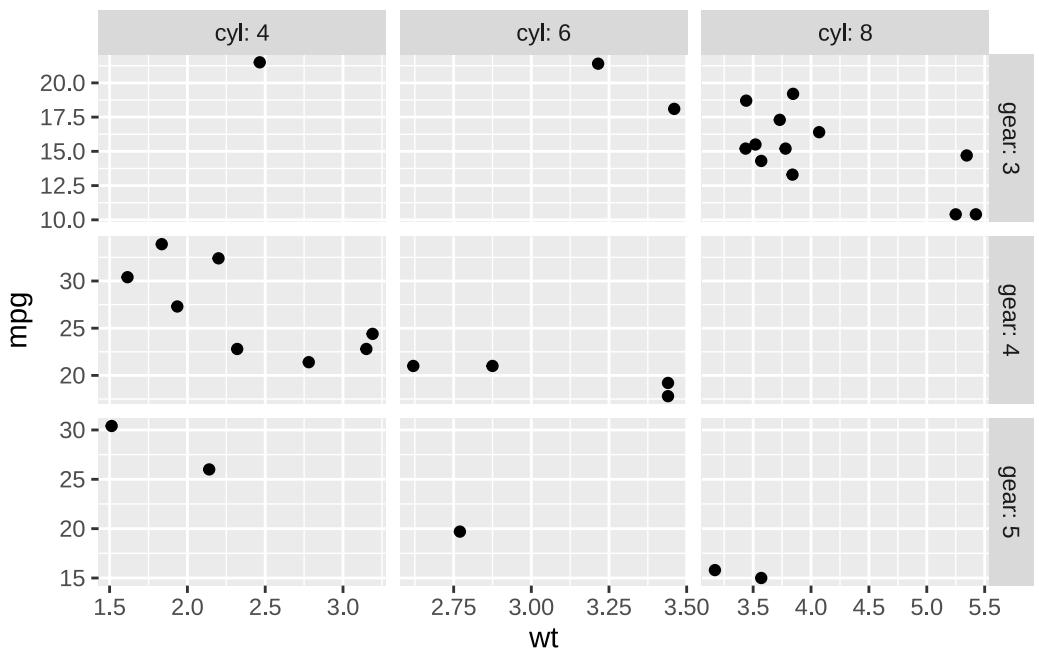

```

p.tmp + facet_grid(rows=vars(gear),cols=vars(cyl),
                    labeller=label_both, scales="fixed")

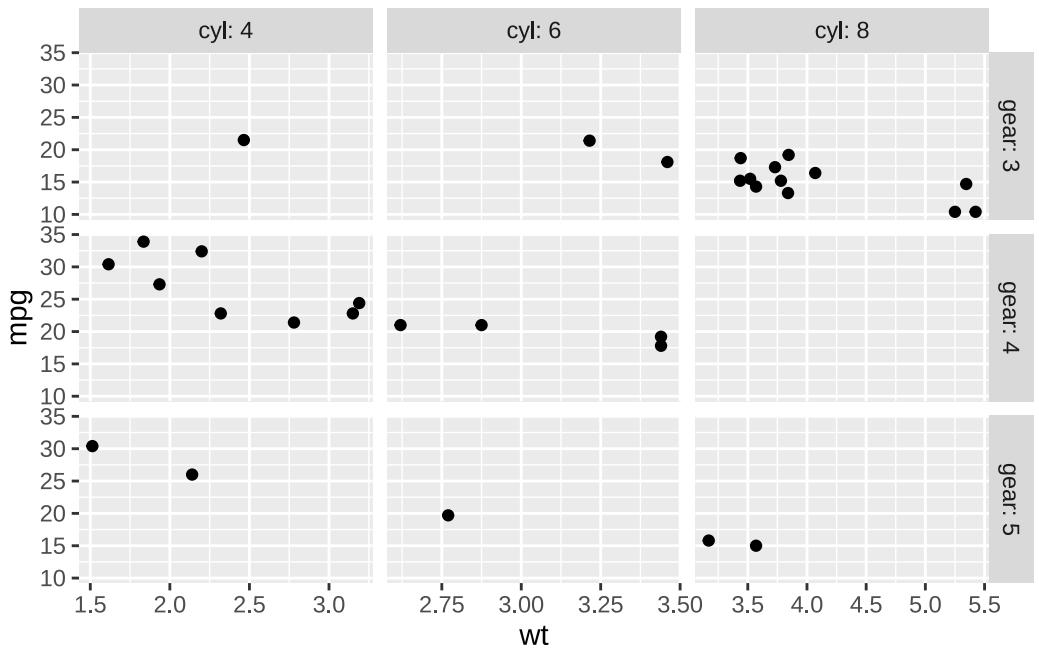

```

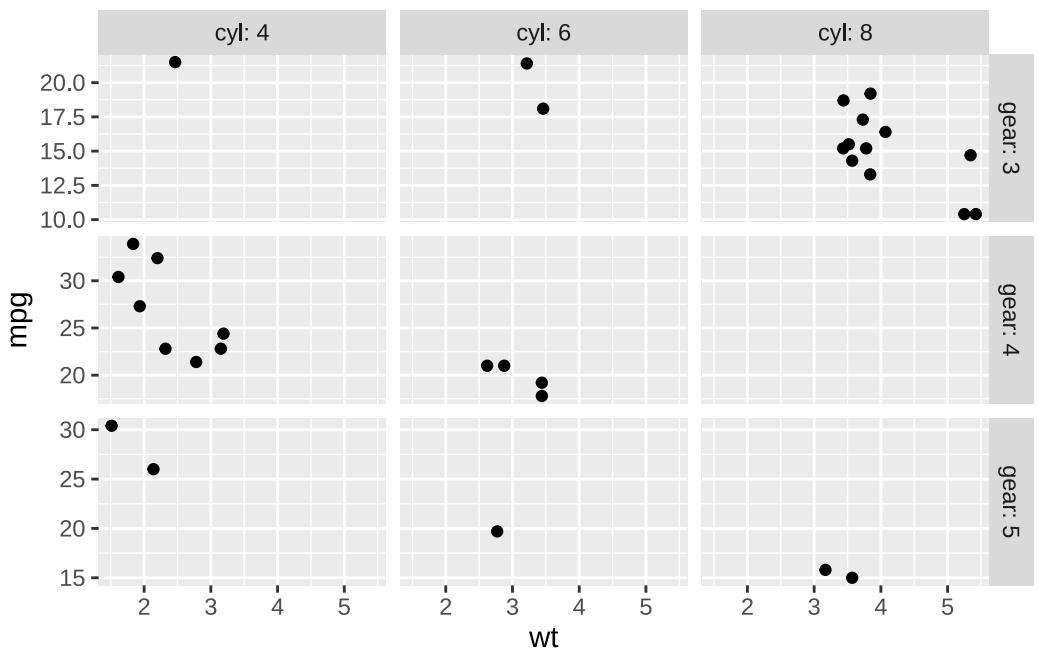

```
p.tmp + facet_grid(rows=vars(gear),cols=vars(cyl),
    labeller=label_both, scales="free")
```

```
p.tmp + facet_grid(rows=vars(gear),cols=vars(cyl),
    labeller=label_both, scales="free_x")
```

```
p.tmp + facet_grid(rows=vars(gear),cols=vars(cyl),
                    labeller=label_both, scales="free_y")
```

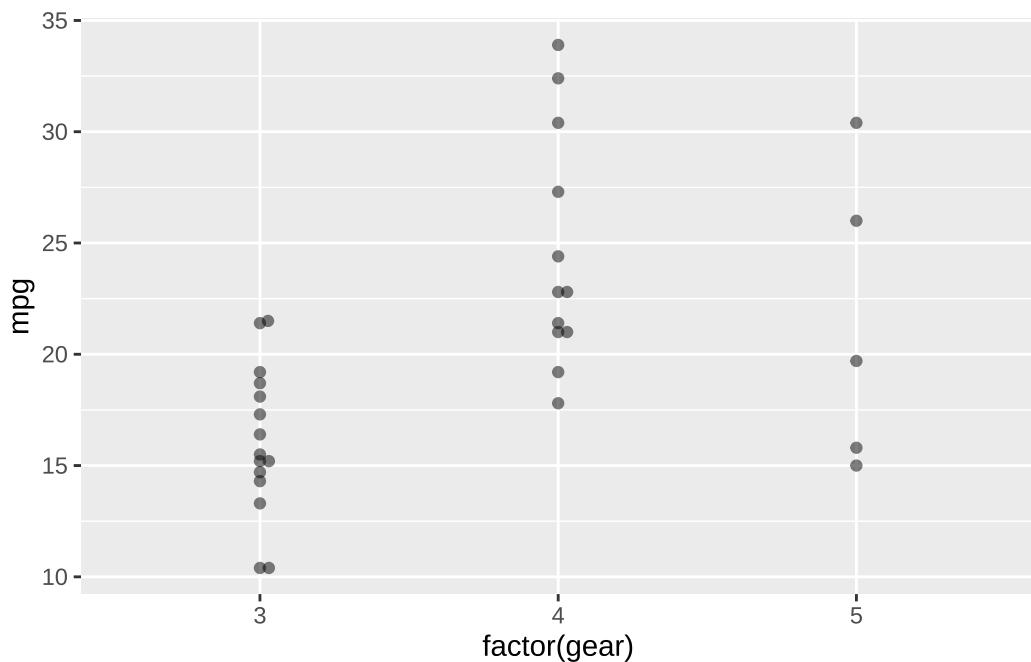

7.12 Showing summaries

While plotting underlying rawdata is pretty informative, adding summary statistics guides the viewer. Error bars help to evaluate differences visible, but need to be labelled!!

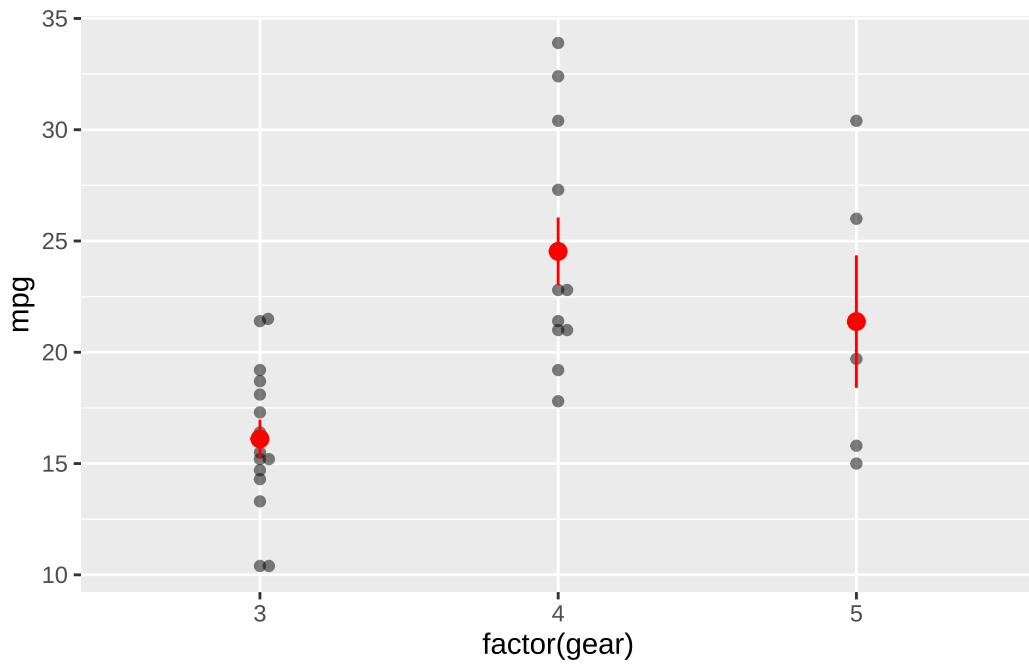

Functions for summary statistics (mean_se, mean_cl_normal, mean_cl_boot etc.) are build on top of Hmisc functions. So this package is needed but not automatically installed with ggplot2.

```
(plottemp <- ggplot(mtcars,aes(factor(gear),mpg))+  
  geom_beeswarm(alpha=.5))
```

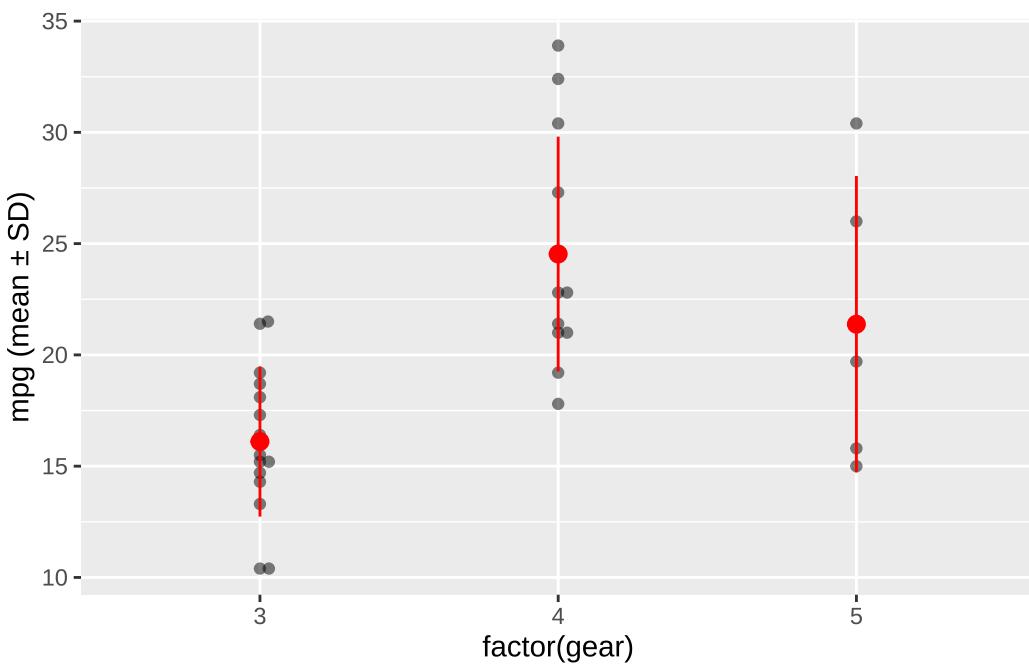

```
plottemp+stat_summary(color="red")
```

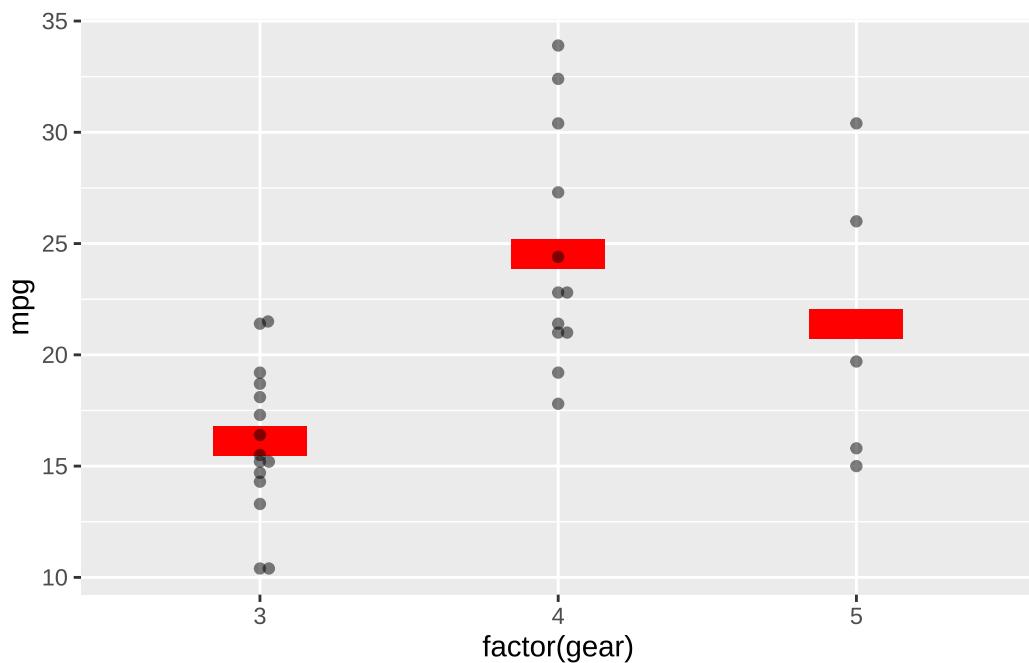

```
No summary function supplied, defaulting to `mean_se()`
```

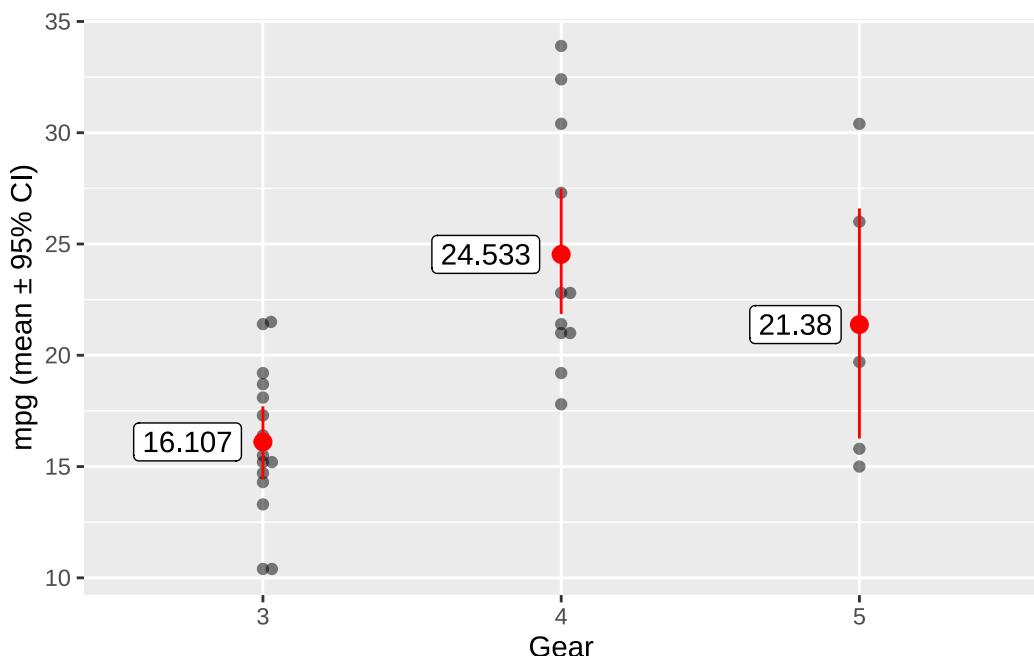

```
plottemp+stat_summary(fun.data="mean_sdl",
                      fun.args=list(mult=1),
                      color="red")+
  ylab("mpg (mean \u00b1 SD)")
```

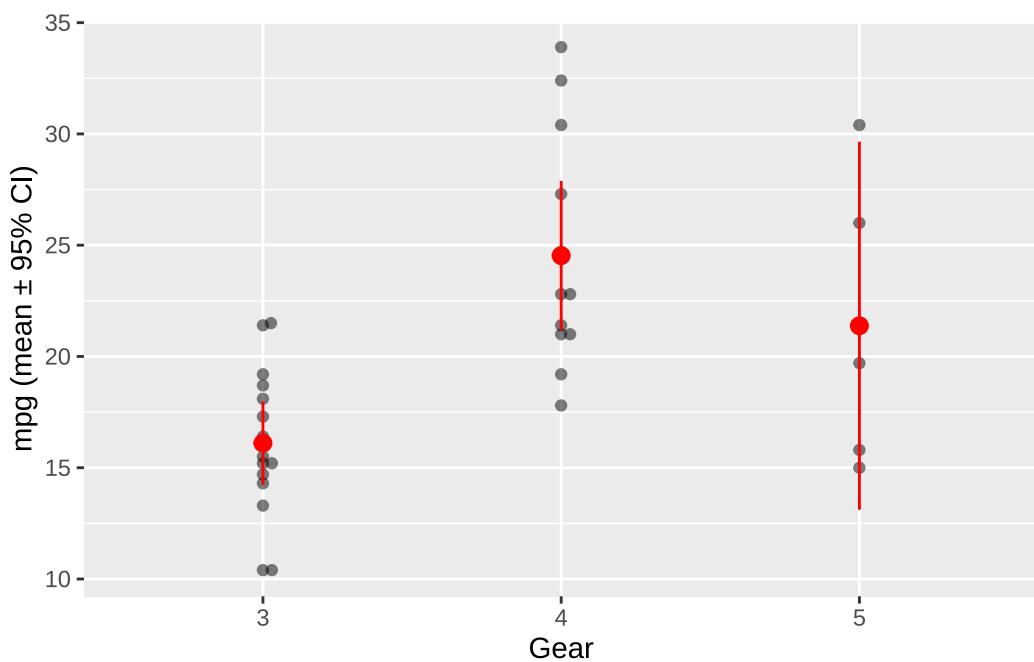

```
ggplot(mtcars,aes(factor(gear),mpg))+  
  stat_summary(geom = "point", shape="-",  
               size=50,  
               fun = "mean",color="red") +  
  geom_beeswarm(alpha=.5)
```

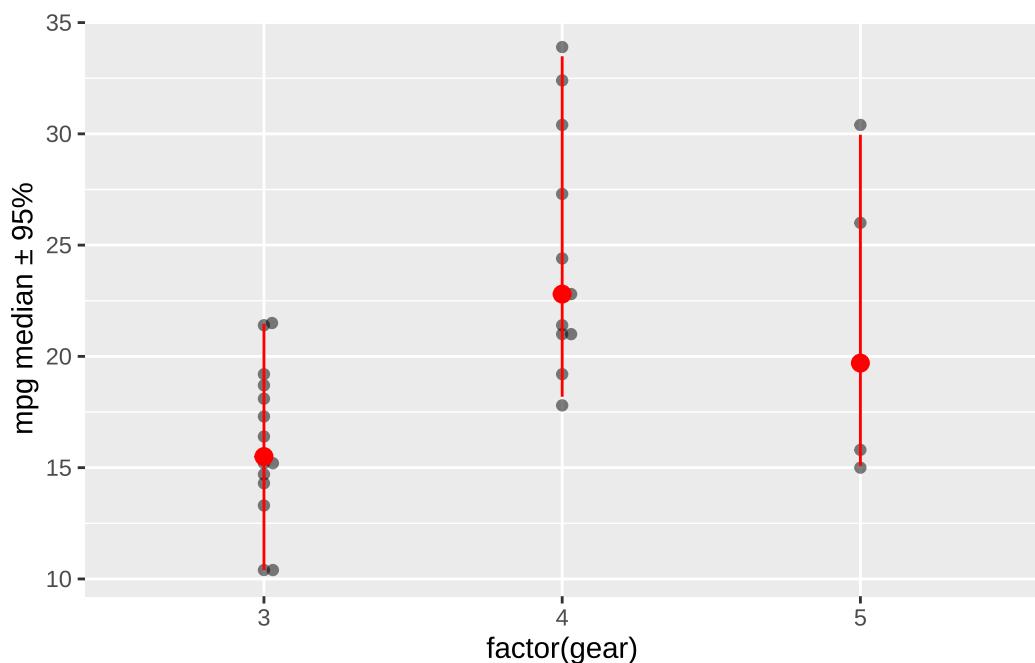

```
means <- mtcars |>  
  group_by(gear) |>  
  summarise(mean=round(mean(mpg),3),sd=sd(mpg))  
plottemp+stat_summary(fun.data="mean_cl_boot",  
                      fun.args=list(B=10^4),  
                      color="red") +  
  geom_label(data=means,  
             aes(factor(gear),mean,label=mean),  
             hjust=1.2)+  
  ylab("mpg (mean \u00b1 95% CI)") +  
  xlab("Gear")
```

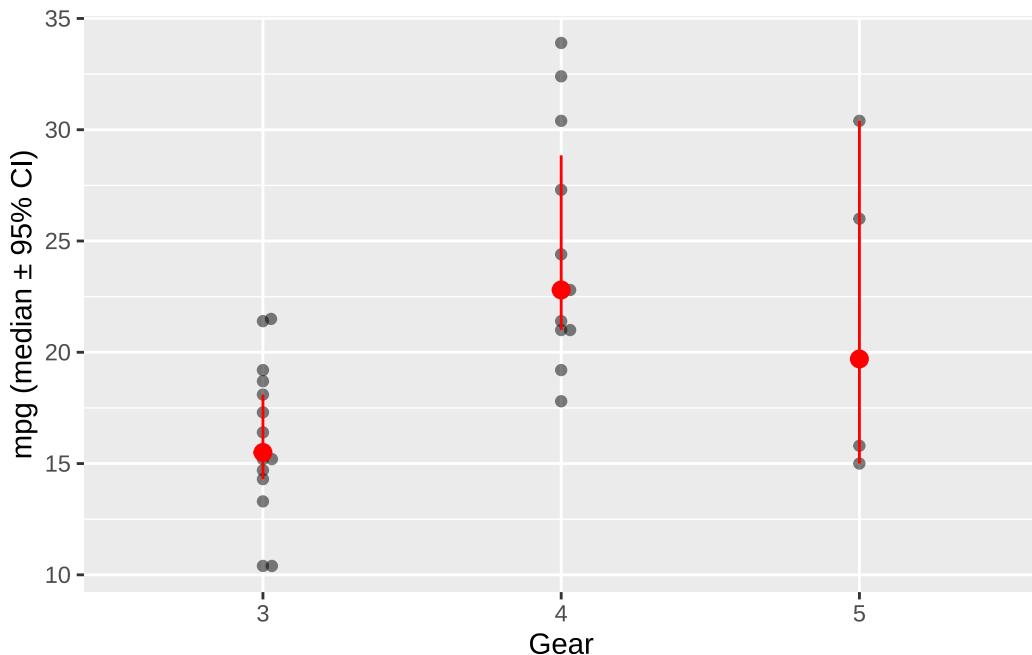

```
plottemp+stat_summary(fun.data="mean_cl_normal",color="red")+
  ylab("mpg (mean \u00b1 95% CI)")+
  xlab("Gear")
```

```
plottemp+stat_summary(fun.data="median_hilow",color="red")+
  ylab("mpg median \u00b1 95%")
```

```
# geom_pointrange()
plottemp+stat_summary(fun.data="median_cl_boot_gg",color="red")+
  ylab("mpg (median \u00b1 95% CI)")+
  xlab("Gear")
```

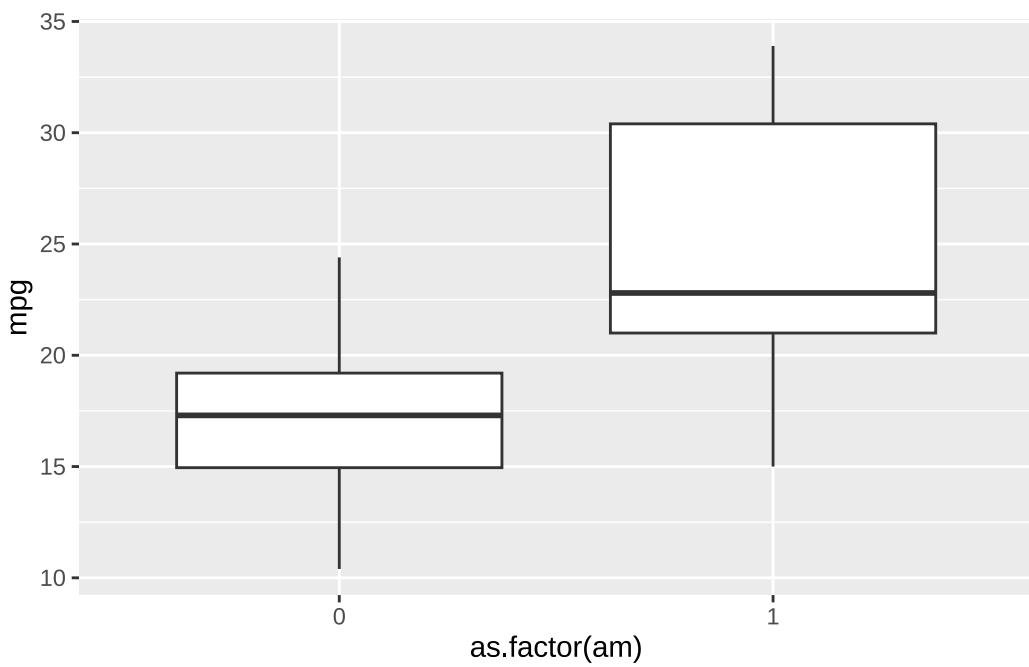

7.13 Indicating significances

Package ggsign makes it easier to add significance brackets (no more photoshopping), it either computes p-values or takes them from your testing (and this is what you should always be doing!).

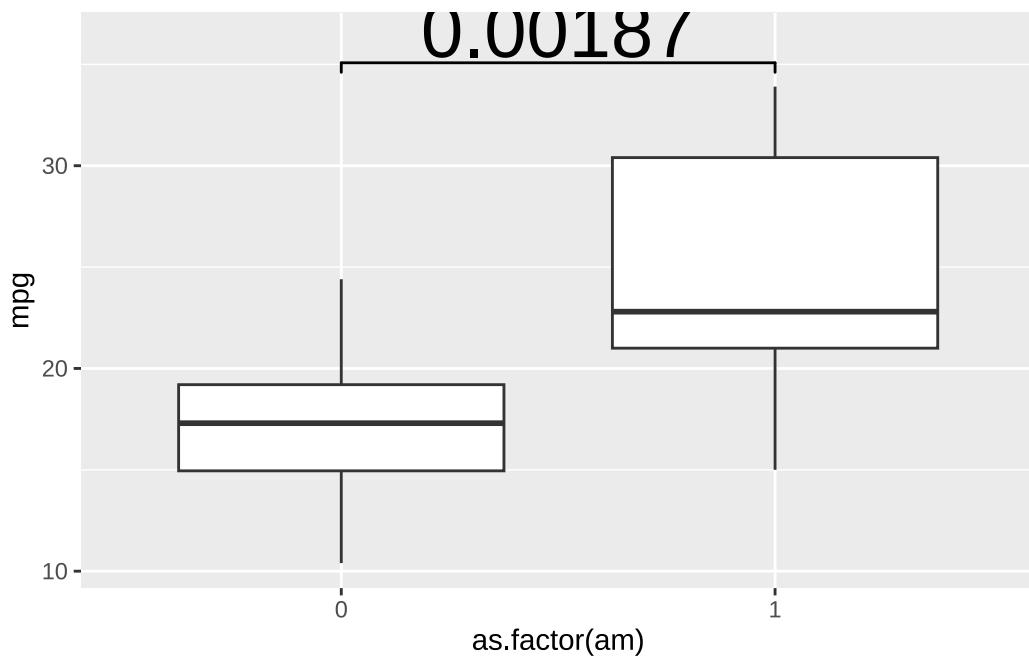

```
# ggsign #####
p <- round(
  wilcox.test(mtcars$mpg~mtcars$am)$p.value,
  5)
```

Warning in wilcox.test.default(x = DATA[[1L]], y = DATA[[2L]], ...): kann bei Bindungen keinen exakten p-Wert Berechnen

```
(plottemp <- ggplot(mtcars,aes(as.factor(am),mpg))+  
  geom_boxplot())
```

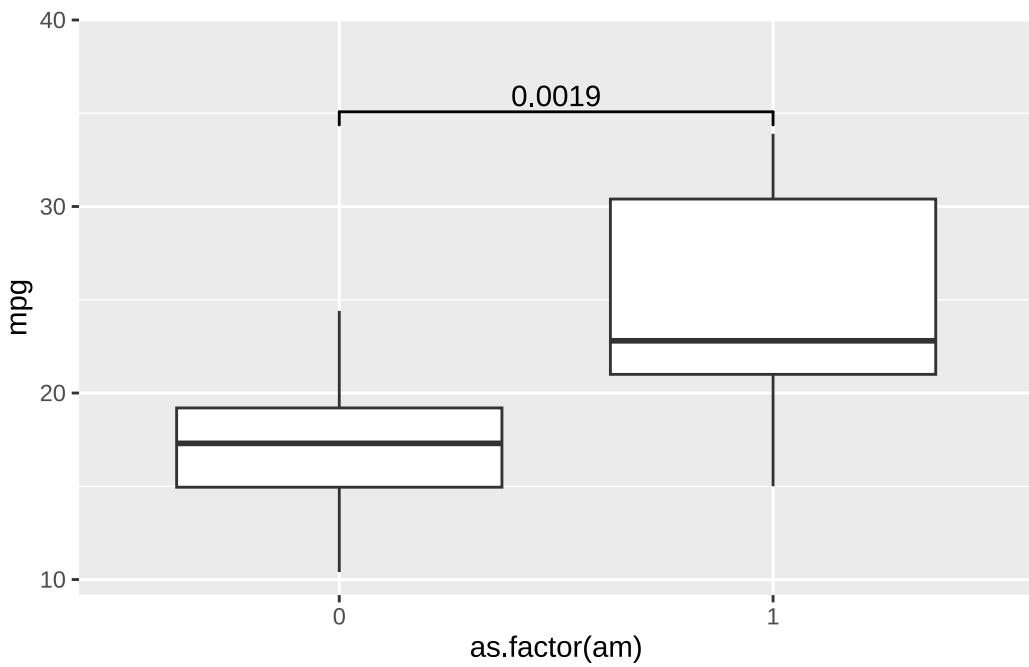

```
plottemp+geom_signif(  
  comparisons=list(c(1,2)),  
  # aes(y=0),  
  textsize = rel(10), vjust = .0,  
  #y_position=max(mtcars$mpg)+3,  
  # annotations=paste0("p = ", p),  
  # annotations=markSign(p),  
  annotations=p,  
  tip_length=.02)+  
  scale_y_continuous(expand = expansion(mult=c(0.05,.1)))
```

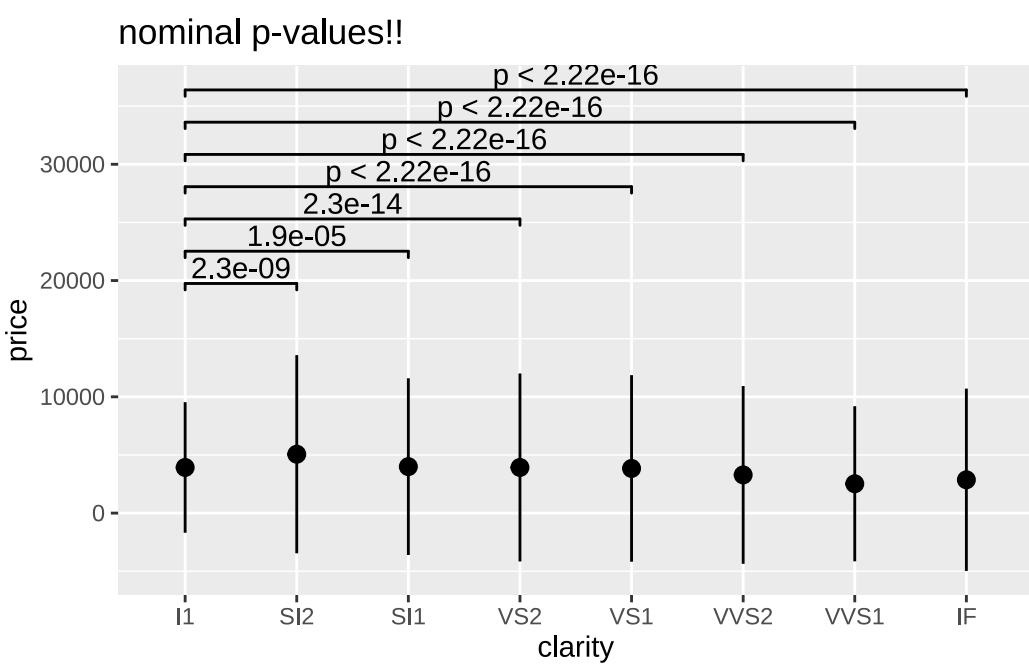

```
plottemp + geom_signif(  
  comparisons=list(1:2))+  
  scale_y_continuous(expand = expansion(mult=c(0.05,.2)))
```

Warning in wilcox.test.default(c(21.4, 18.7, 18.1, 14.3, 24.4, 22.8, 19.2, :
kann bei Bindungen keinen exakten p-Wert Berechnen

```
ggplot(diamonds,aes(clarity, price))+
  stat_summary(fun.data=mean_sdl)+
  geom_signif(comparisons=list(c(1,2),c(1,3),c(1,4),c(1,5),
                                c(1,6),c(1,7),c(1,8)),
               step_increase = 0.15)+
  ggtitle("nominal p-values!!")
```

```

ggplot(diamonds,aes(clarity, price))+  

  stat_summary(fun.data=mean_sdl)+  

  geom_signif(comparisons=list(c(1,2),c(2,3),c(3,4),c(4,5),  

                               c(5,6),c(6,7),c(7,8)),  

              step_increase = 0.15)+  

  ggtitle("nominal p-values!!")

```

nominal p-values!!

```

ggplot(diamonds,aes(clarity, price))+  

  stat_summary(fun.data=mean_sdl)+  

  geom_signif(comparisons=list(c(1,2),c(2,3),c(3,4),c(4,5),  

                               c(5,6),c(6,7),c(7,8)),  

              map_signif_level = TRUE,  

              extend_line = -.01)+  

  ggtitle("nominal p-values!!")+
  scale_y_continuous(expand = expansion(mult=c(0.05,.1)))

```

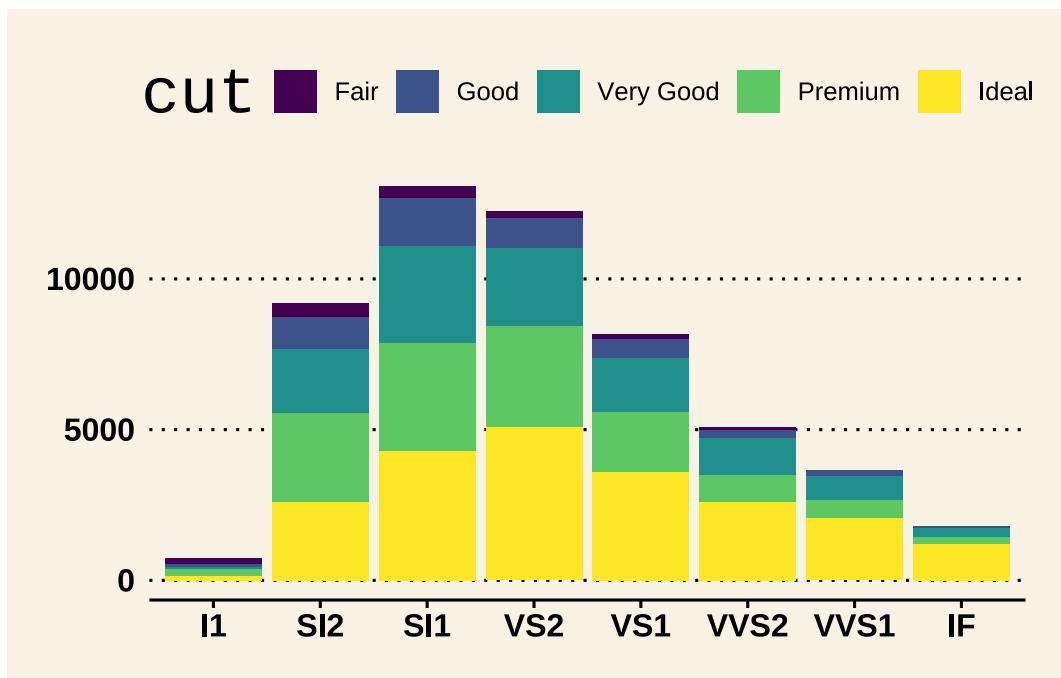

nominal p-values!!

7.14 Theme definitions / changes

Themes define everything not-data-related in your figures, like margins, fonts, background color etc. There are many predefined themes, and all can be customized. You can change a theme for all plots to come (`theme_update()`) or just a single plot (`+theme()`)

```
old <- theme_set(theme_wsj())
ggplot(data=diamonds,aes(x=clarity,fill=cut))+  
  geom_bar()
```

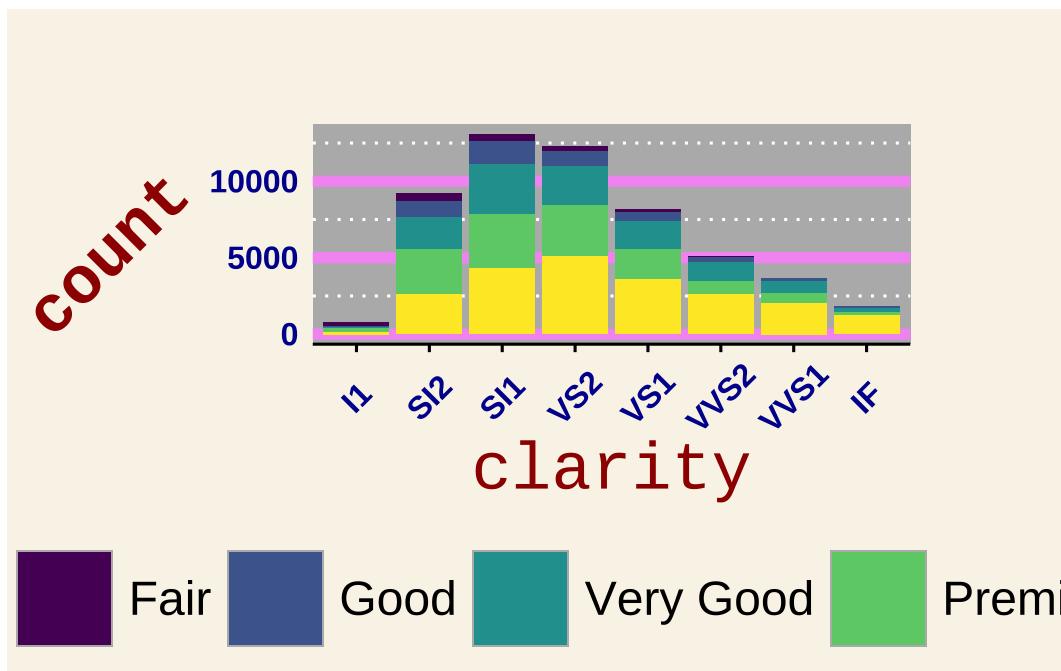

```

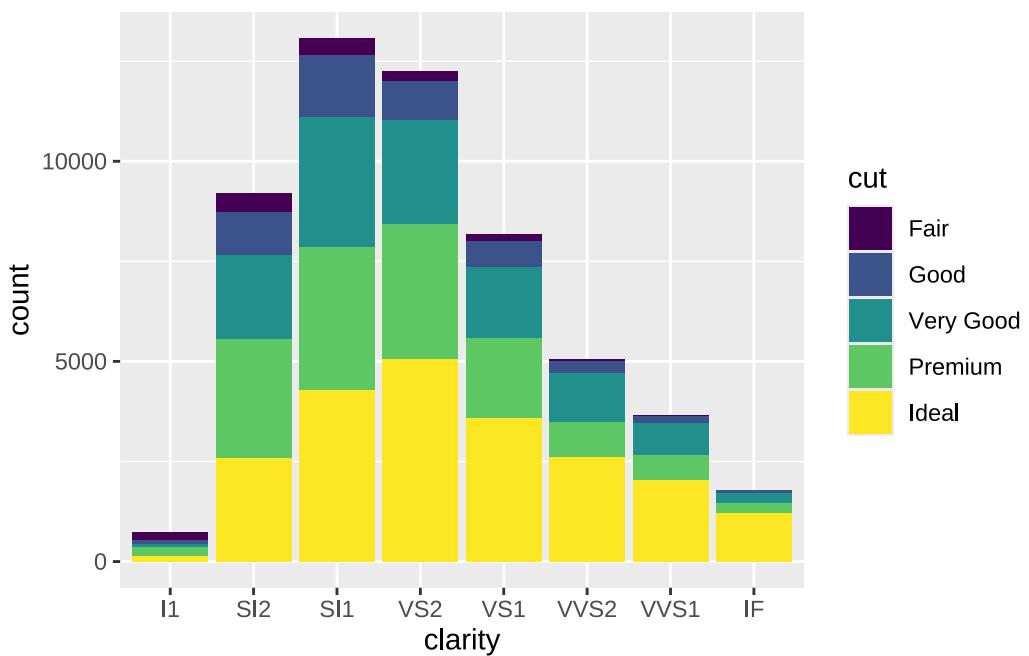

theme_update(legend.position="bottom",
             axis.text=element_text(colour = "darkblue",
                                   size=12),
             axis.text.x=element_text(vjust=0.5,angle=45,
                                      family="sans",
                                      face = "bold"),
             axis.title=element_text(size=25,
                                    color="darkred"),
             plot.margin=unit(c(3,4,.5,.3),"lines"),      #N,E,S,W
             axis.title.y=element_text(vjust=0.4,angle=45,
                                       face="bold"),
             legend.key.size=unit(2.5, "lines"),
             panel.background=element_rect(fill="darkgrey"),
             panel.grid.minor = element_line(colour="white"),
             panel.grid.major = element_line(
               linetype=1,
               color="violet", linewidth = 2),
             legend.text = element_text(size = 18),
             legend.title=element_text(size=30, color="pink"))

ggplot(data=diamonds,aes(x=clarity,fill=cut))+
  geom_bar()

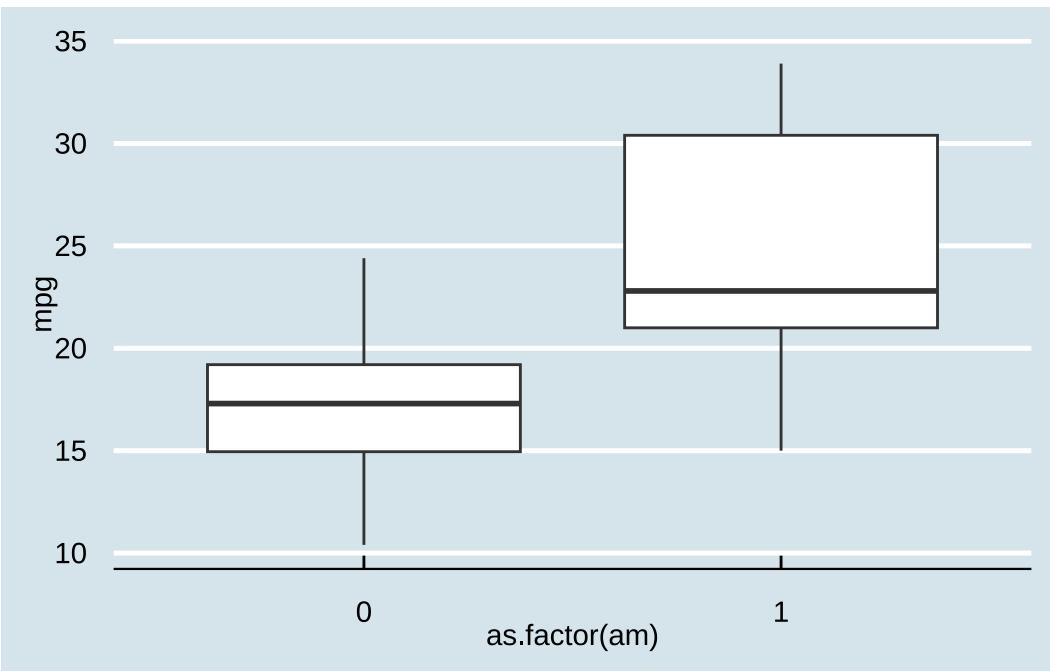

```

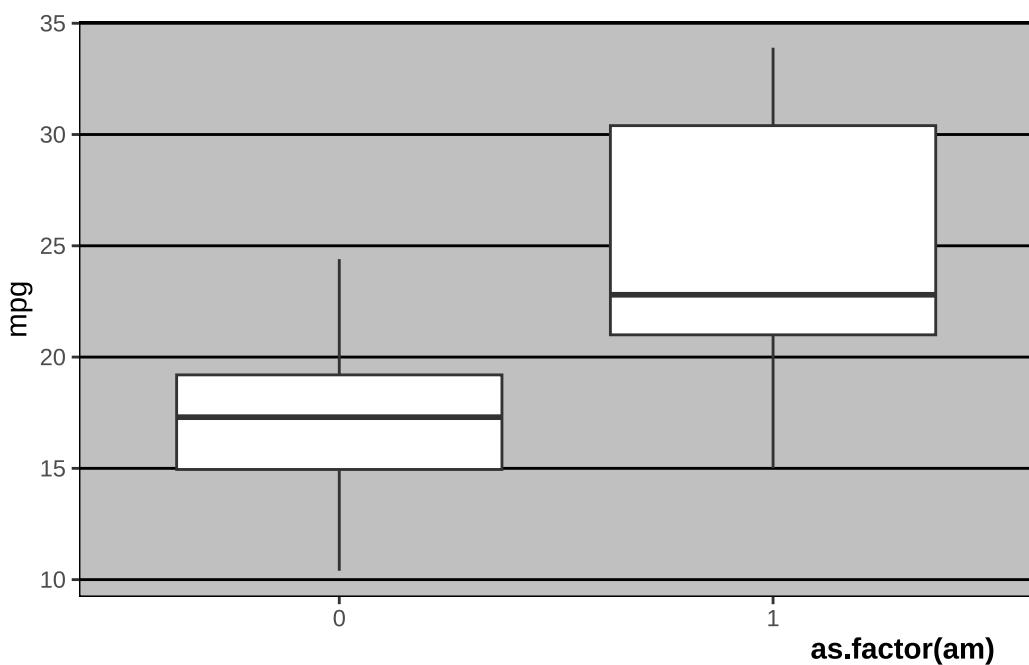

```
theme_set(theme_grey())
#theme_set(old)
ggplot(data=diamonds,aes(x=clarity,fill=cut))+  
  geom_bar()
```

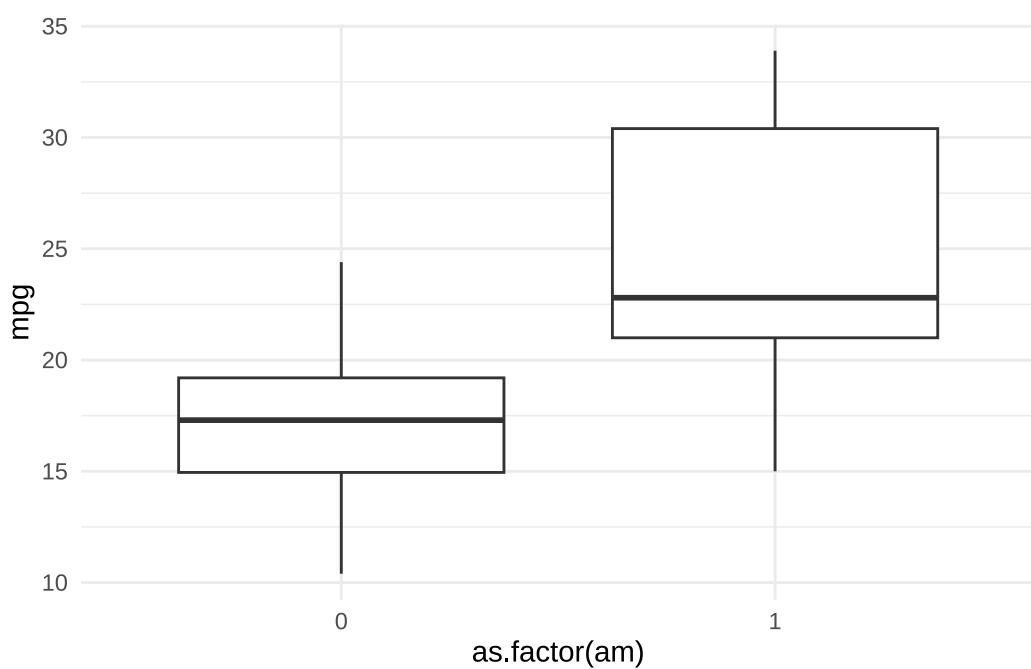

```
# ggthemes #####
plottemp+theme_economist()
```

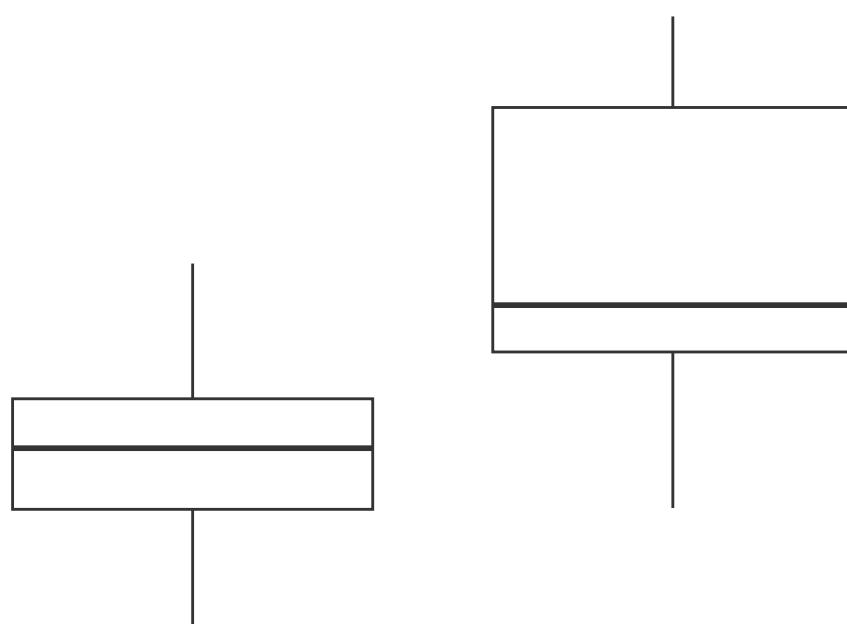

```
plottemp+theme_excel()+
  theme(axis.title.x = element_text(face="bold", hjust=0.95))
```

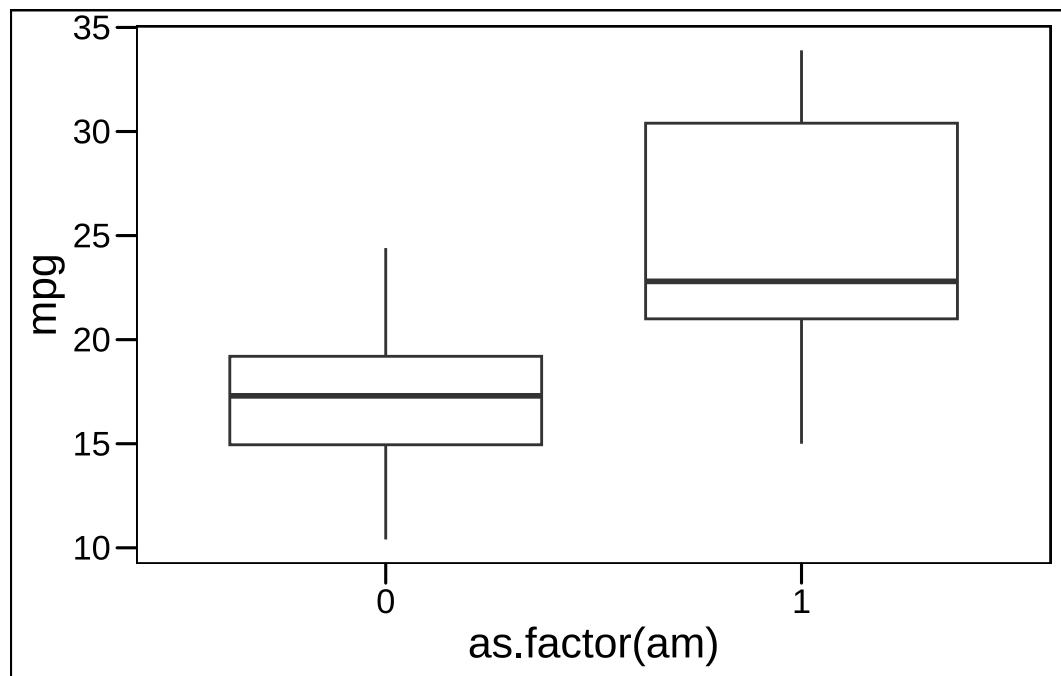

```
plottemp+theme_minimal()
```

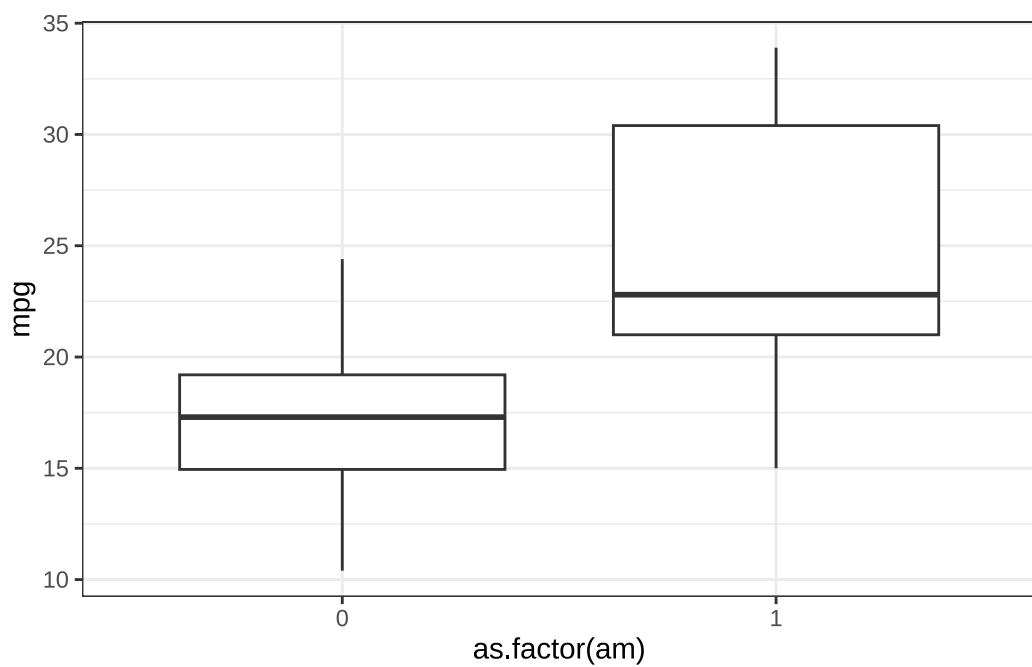

```
plottemp+theme_void()
```

```
plottemp+theme_base()
```

```
plottemp+theme_bw()
```

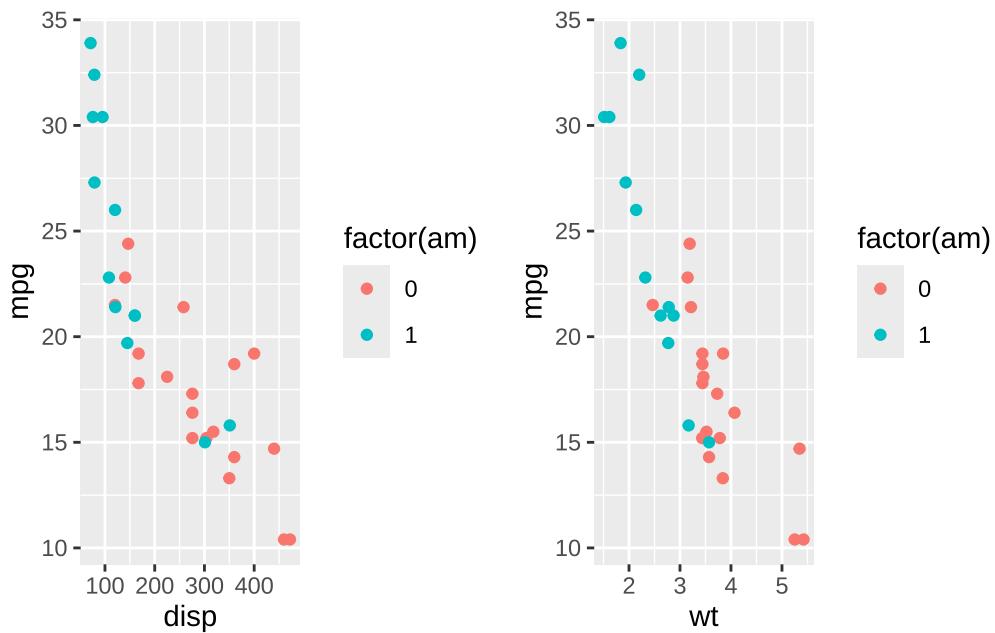

```
# https://www.data-imaginist.com/2019/a-flurry-of-facets/

```

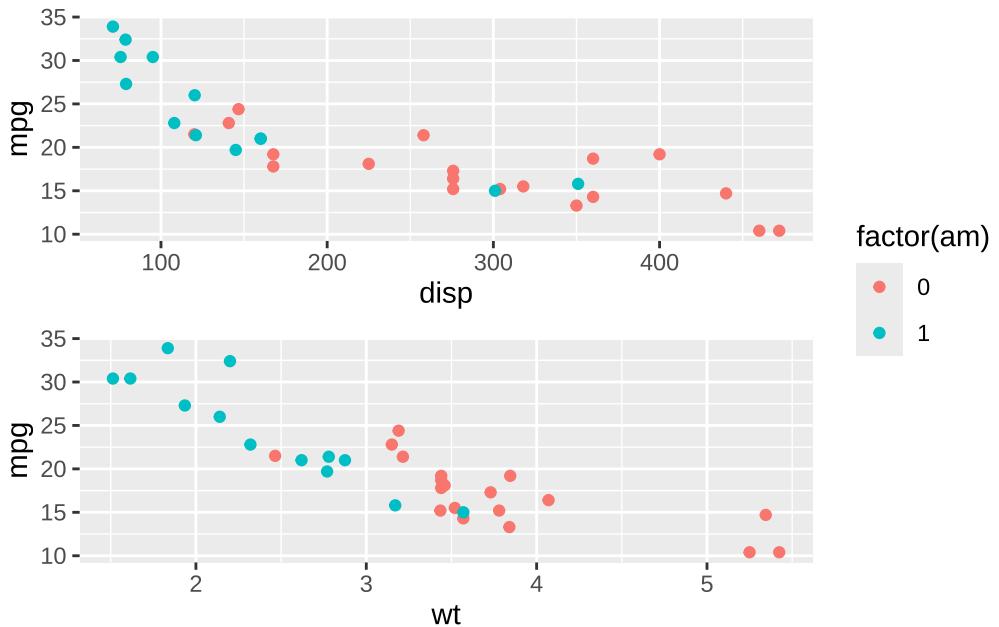

7.15 Combining figures with patchwork

More details on [github](#)

```
p1 <- ggplot(mtcars) +  
  geom_point(aes(disp, mpg, color=factor(am)))  
p2 <- ggplot(mtcars) +  
  geom_point(aes(wt, mpg, color=factor(am)))  
p1 | p2
```

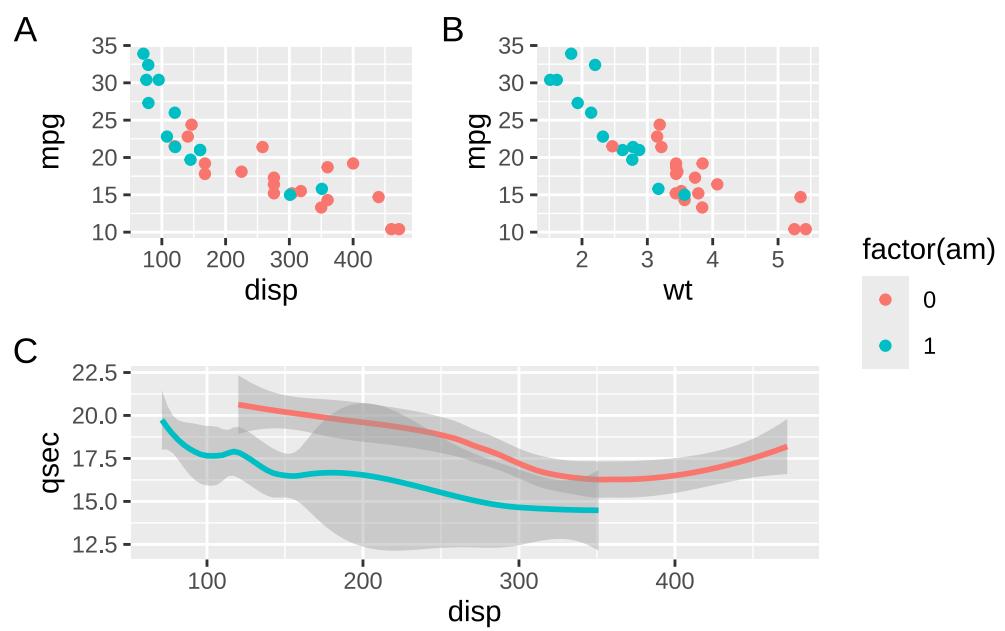

```
(p1 / p2) +  
  plot_layout(guides = "collect")
```

```
p3 <- ggplot(mtcars) +
  geom_smooth(aes(disp, qsec, color=factor(am)))
# p4 <- ggplot(mtcars) +
#   geom_bar(aes(factor(carb)), fill=factor(am))

(p1 | p2) /
  (p3 + guides(color = "none")) +
  plot_annotation(tag_levels = "A") +
  plot_layout(guides = "collect")
```

```
`geom_smooth()` using method = 'loess' and formula = 'y ~ x'
```

8 Descriptive statistics

Descriptive statistics are used to summarize and organize data in a manner that is meaningful and useful. They provide simple summaries about the sample and the measures, such as mean, median, standard deviation, or frequencies. Furthermore, they allow for the presentation of quantitative descriptions in a manageable form, aiding in understanding the data distribution and central tendency. For group comparisons, they will inform about direction and magnitude of differences.

8.1 Reading in data

```
pacman::p_load(conflicted,tidyverse,wrappedtools,
                 flextable)
set_flextable_defaults(font.size = 9,
                       padding.bottom = 1,
                       padding.top = 3,
                       padding.left = 3,
                       padding.right = 4
) #dir("Data/")
load("data/bookdata1.RData")
```

8.2 Graphical exploration should start before descriptive statistics

```
ggplot(rawdata,aes(`sysBP V0`, `diaBP V0`))+
  geom_point()+
  geom_smooth(se=F)+
  geom_smooth(method="lm",color="red",
             fill="gold", alpha=.15)
```

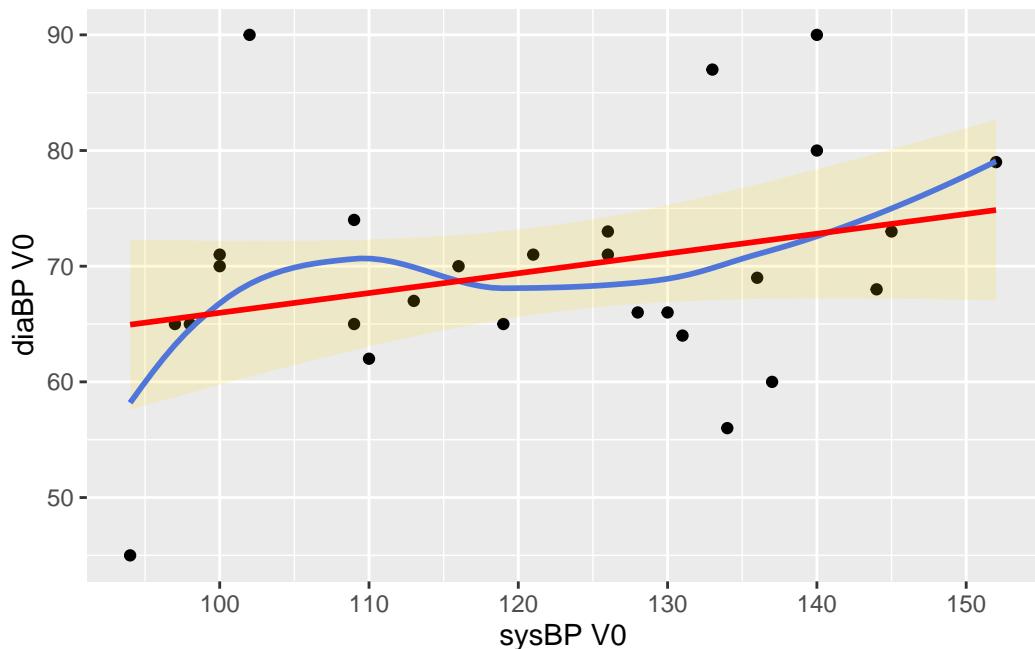

`geom_smooth()` using method = 'loess' and formula = 'y ~ x'

Warning: Removed 1 row containing non-finite outside the scale range
(`stat_smooth()`).

```
`geom_smooth()` using formula = 'y ~ x'
```

```
Warning: Removed 1 row containing non-finite outside the scale range  
(`stat_smooth()`).
```

```
Warning: Removed 1 row containing missing values or values outside the scale range  
(`geom_point()`).
```

8.3 Gaussian variables

8.3.1 Simple function calls

```
(mean_size <- mean(rawdata$`Size (cm)`))
```

```
[1] 174.1071
```

```
(sd_size <- sd(rawdata$`Size (cm)`))
```

```
[1] 7.771454
```

```
min(rawdata$`Size (cm)`)
```

```
[1] 160
```

```
SEM(rawdata$`Size (cm)`)
```

```
[1] 1.468667
```

8.3.2 Combined reporting

For publishable tables you should round the numbers to a reasonable number of digits. Function `roundR()` is more flexible than base `round()`, as it determines the number of digits necessary to obtain the desired precision. The `level` argument allows for rounding to a specific number of non-zero digits. The `.german` argument changes the decimal point to a comma.

```
round(mean_size,digits = 2)
```

```
[1] 174.11
```

```
roundR(mean_size,level = 2)
```

```
[1] "174"
```

Usually mean and sd are reported together, function `meansd()` computes, rounds, and pastes the statistics in one go, arguments allow for flexible reporting:

```
meansd(rawdata$`Size (cm)`, roundDig = 4,  
       range = TRUE,add_n = TRUE)
```

```
[1] "174.1 ± 7.8 [160.0 -> 193.0] [n=28]"
```

```
meansd(rawdata$`sysBP V0`, roundDig = 4,  
       range = TRUE,  
       add_n = TRUE,.german = TRUE)
```

```
[1] "121,9 ± 16,9 [94,0 -> 152,0] [n=27]"
```

```
meanse(rawdata$`Size (cm)`, roundDig = 4)
```

```
[1] "174.1 ± 1.5"
```

8.4 Ordinal variables

```
median(rawdata$`Size (cm)`)
```

```
[1] 173.5
```

```
quantile(rawdata$`Size (cm)`,probs = c(.25,.75))
```

```
25%      75%
168.00 178.25
```

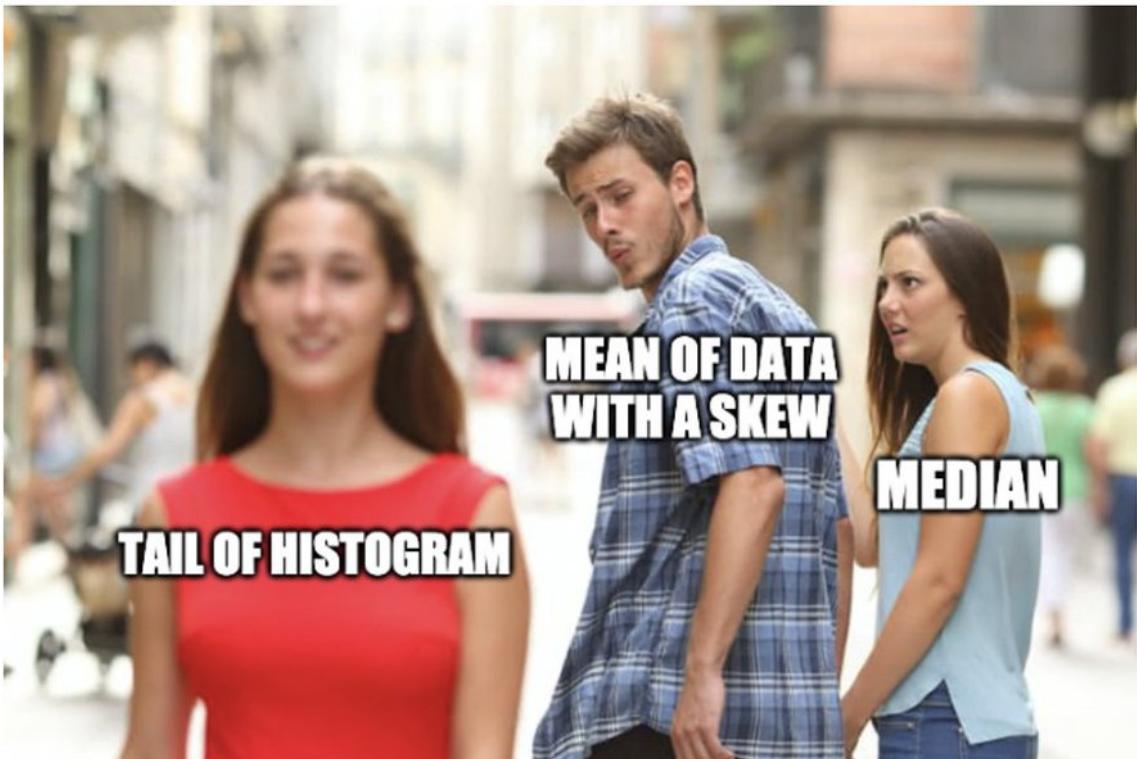

```
median_quart(rawdata$`Size (cm)`)
```

```
[1] "174 (168/179)"
```

```
median_quart(rawdata$Age,range = T)
```

```
[1] "62 (53/67) [43 -> 74]"
```

Median and quartiles are sometimes the better choice even when assuming a Normal distribution, if there are outliers.

8.5 Categorical variables

```
table(rawdata$Sex, useNA = "a")
```

```
f      m <NA>
4     24     0
```

```
sex_count <- table(rawdata$Sex, useNA = "ifany")
table(rawdata$`NYHA V2`,useNA = "always")
```

```
0      1      2      3 <NA>
1      6      2      2     17
```

```
table(rawdata$`NYHA V2`,useNA = "i")
```

```
0      1      2      3 <NA>
1      6      2      2     17
```

```
table(rawdata$`NYHA V2`,useNA = "no")
```

```
0 1 2 3
1 6 2 2
```

```
randomize <- table(rawdata$Sex, rawdata$Testmedication)
prop.table(sex_count)
```

```
f          m
0.1428571 0.8571429
```

```
prop.table(randomize,margin = 2)*100
```

```
0          1
f 14.28571 14.28571
m 85.71429 85.71429
```

```
cat_desc_stats(rawdata$`NYHA V2`)
```

```
$level
# A tibble: 4 x 1
  value
  <chr>
1 0
2 1
3 2
4 3

$freq
# A tibble: 4 x 1
  desc
  <chr>
1 1 (9%)
2 6 (55%)
3 2 (18%)
4 2 (18%)
```

```
cat_desc_stats(rawdata$Sex, singleline = TRUE)
```

```
$level
[1] "f m"

$freq
# A tibble: 1 x 1
  desc
  <glue>
1 4 (14%) 24 (86%)
```

```
rawdata |>
  mutate(Testmedication=factor(Testmedication,
                                levels=0:1,
                                labels=c("Placebo",
                                         "Verum"))) |>
  cat_desc_table(
    desc_vars = factvars$names) |>
  rename(`n (%)`=desc_all) |>
  flextable() |>
  align(i = ~`n (%)`!=" ", j = 1, align = "right") |>
  width(j = c(1,2), width = c(3,4), unit = "cm") |>
```

```
bg(~`n` (%)`==` "",bg='lightgrey')
```

Variable	n (%)
Testmedication	
Placebo	14 (50%)
Verum	14 (50%)
Sex	
f	4 (14.29%)
m	24 (85.71%)
NYHA V1	
0	2 (11.76%)
1	9 (52.94%)
2	3 (17.65%)
3	3 (17.65%)
NYHA V2	
0	1 (9.09%)
1	6 (54.55%)
2	2 (18.18%)
3	2 (18.18%)
NYHA V3	
1	6 (50%)
2	3 (25%)
3	3 (25%)

```
# cat(" \n\n")
```

8.6 Summarize data

When creating tables with descriptive statistics, you usually report on more than just 1 variable in more than just 1 subgroup, and there may be more than 1 statistics to report. `Summarize()`, often in combination with `across()`, makes that task easier:

```

rawdata |>
  group_by(Testmedication, Sex) |>
  summarise(WeightSummary=meansd(`Weight (kg)`, add_n = TRUE),
             .groups="drop") |>
  flextable()

```

Testmedication	Sex	WeightSummary
0	f	86 ± 9 [n=2]
0	m	91 ± 14 [n=12]
1	f	66 ± 3 [n=2]
1	m	90 ± 14 [n=12]

```

# cat("<br>\n\n")

rawdata |>
  group_by(Sex) |>
  summarize(across(gaussvars$names,
                    .fns=~meansd(.x, range=T))) |>
  pivot_longer(cols=-Sex,
                names_to="Variable") |>
  pivot_wider(names_from=Sex) |>
  flextable()

```

Variable	f	m
Size (cm)	165 ± 4 [160 -> 168]	176 ± 7 [161 -> 193]
Weight (kg)	76 ± 13 [64 -> 93]	90 ± 14 [74 -> 120]
sysBP V0	118 ± 14 [102 -> 130]	123 ± 18 [94 -> 152]
diaBP V0	71 ± 13 [62 -> 90]	69 ± 9 [45 -> 90]
Lv Edv Mri	235 ± 72 [184 -> 286]	203 ± 71 [118 -> 379]

11 Intro to lm

In this chapter, linear models (including linear regression and ANOVA) will be introduced. Output is not optimized for print, but rather for interactive use.

11.1 Setup

All packages necessary will be invoked by `p_load`. Packages with only a single function call or potential for name conflicts can be unloaded, this way we still checked for their existence and installed them if need be.

```
pacman::p_load(conflicted,wrappedtools,car,nlme,broom,
                 multcomp,tidyverse,foreign,DescTools, ez,
                 ggbeeswarm,
                 lme4, nlme,merTools,
                 easystats, patchwork,here)#conflicted,
# rayshader,av)
# pacman::p_unload(DescTools, foreign)
# conflict_scout()
conflicts_prefer(dplyr::select,
                  dplyr::filter,
                  modelbased::standardize)
```

```
[conflicted] Will prefer dplyr::select over any other package.
[conflicted] Will prefer dplyr::filter over any other package.
[conflicted] Will prefer modelbased::standardize over any other package.
```

```
base_dir <- here::here()
```

11.2 Import / Preparation

Data are read from an SPSS file. Numeric column Passage is mutated into a factor as `Passage_F`, this is necessary for group comparisons in ANOVA. The call to `here()` expands the path to a file from the project directory to the full system path.

```

rawdata<-foreign::read.spss(file=here('Data/Zellbeads.sav'),
                             use.value.labels=T,to.data.frame=T) |>
  as_tibble() |>
  dplyr::select(-ZahlZellen) |>
  rename(Growth=Wachstum,Treatment=Bedingung) |>
  mutate(Passage_F=factor(Passage),
         Treatment=fct_recode(Treatment,
                               Control="Kontrolle"))

```

Zurückkodierung von CP1252

11.3 Graphical exploration

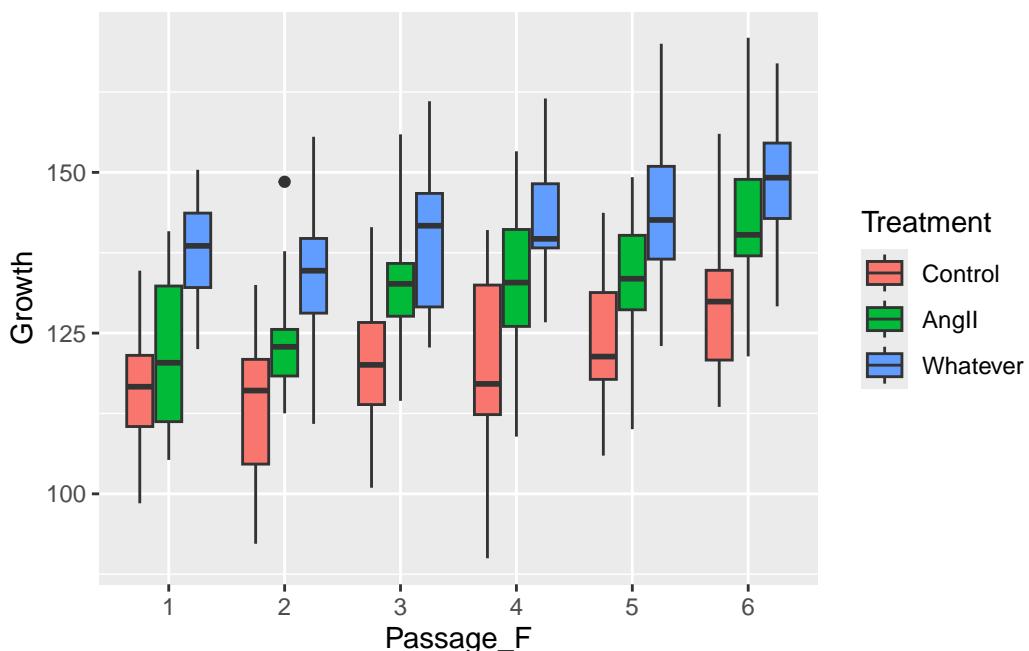

First impression of the data will be attempted by grouped boxplot, followed by interaction plots, both as basic and ggplot with variations.

```

ggplot(rawdata,aes(Passage_F,Growth, fill=Treatment))+  

  geom_boxplot(coef=3)

```

```

with(rawdata, interaction.plot(  

  x.factor=Passage, trace.factor=Treatment, response=Growth,  

  ylim = c(90, 160), lty = c(1,3,12), lwd = 5,  

  ylab = "Growth", xlab = "Passage",

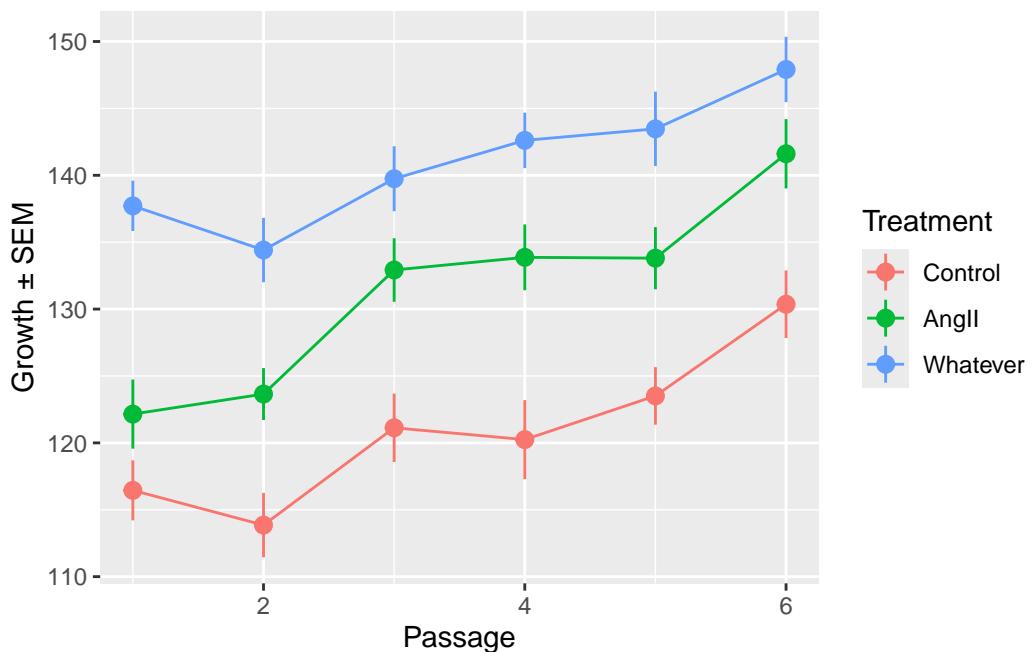

```

```
trace.label = "Treatment"))
```

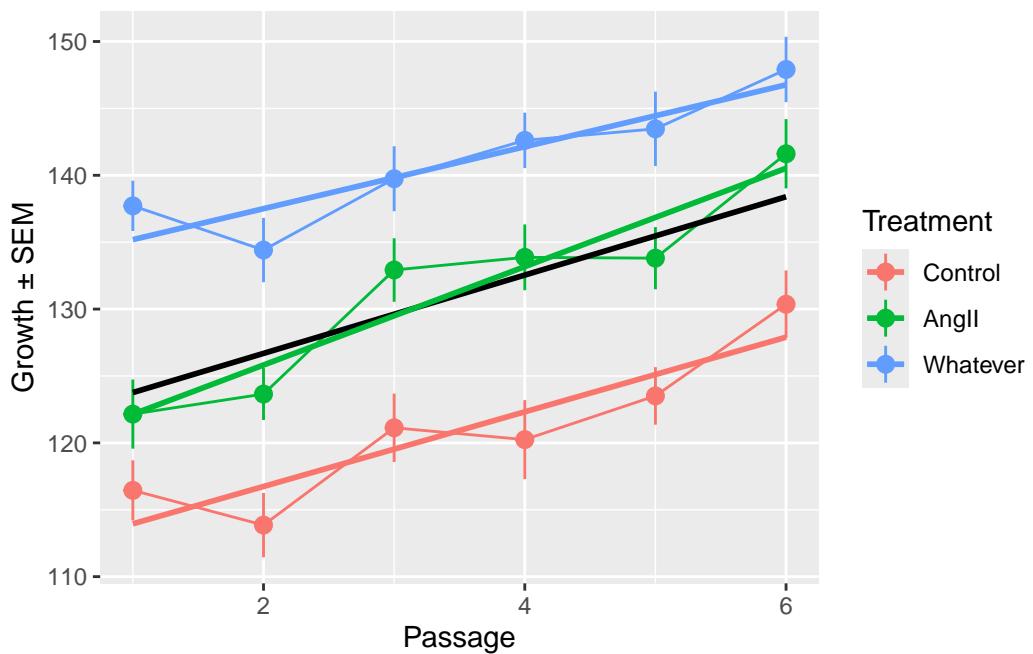

```
# p1<-ggplot(rawdata,aes(x=Passage,y=Growth))+  
#   stat_summary(geom='line',fun='mean',aes(color=Treatment))+  
#   stat_summary(geom='line',fun='mean')  
p1<-ggplot(rawdata,aes(x=Passage,y=Growth))+  
  stat_summary(geom='line',fun='mean',aes(color=Treatment))+  
  stat_summary(aes(color=Treatment))+  
  ylab('Growth \u00b1 SEM')  
p1
```

```
No summary function supplied, defaulting to `mean_se()`
```

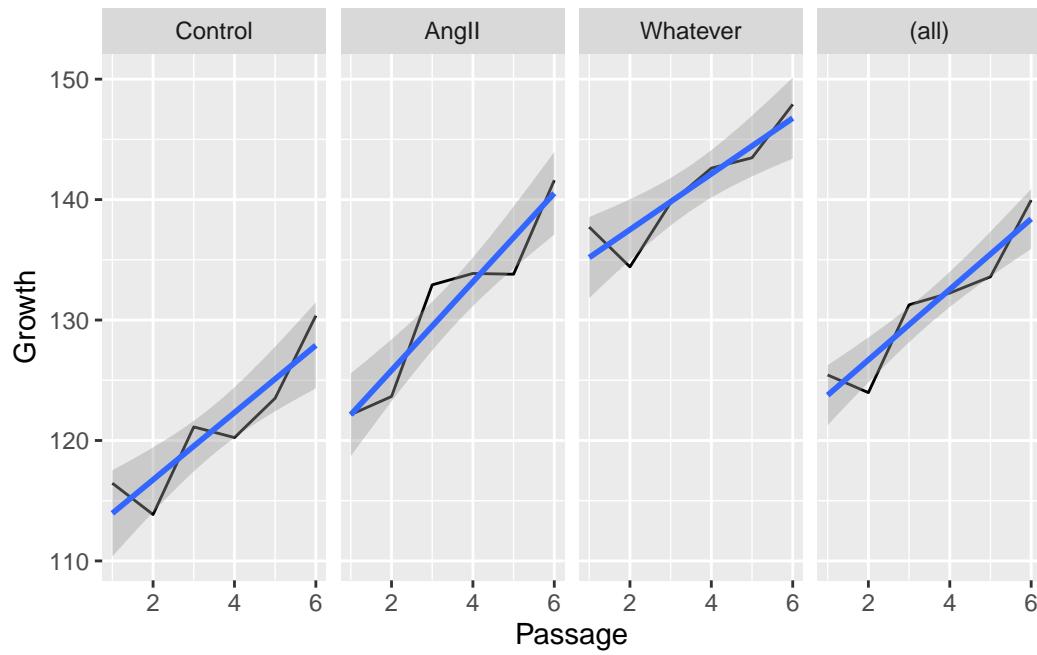

```
p1+geom_smooth(method='lm',color='black',se=F)+  
  geom_smooth(method='lm',aes(color=Treatment),se=F)
```

```
No summary function supplied, defaulting to `mean_se()`  
`geom_smooth()` using formula = 'y ~ x'  
`geom_smooth()` using formula = 'y ~ x'
```

```
ggplot(rawdata,aes(x=Passage,y=Growth))+  
  stat_summary(geom='line',fun='mean')+  
  geom_smooth(method='lm')+  
  facet_grid(cols = vars(Treatment), margins=T)  
  
`geom_smooth()` using formula = 'y ~ x'
```

11.4 Linear Models

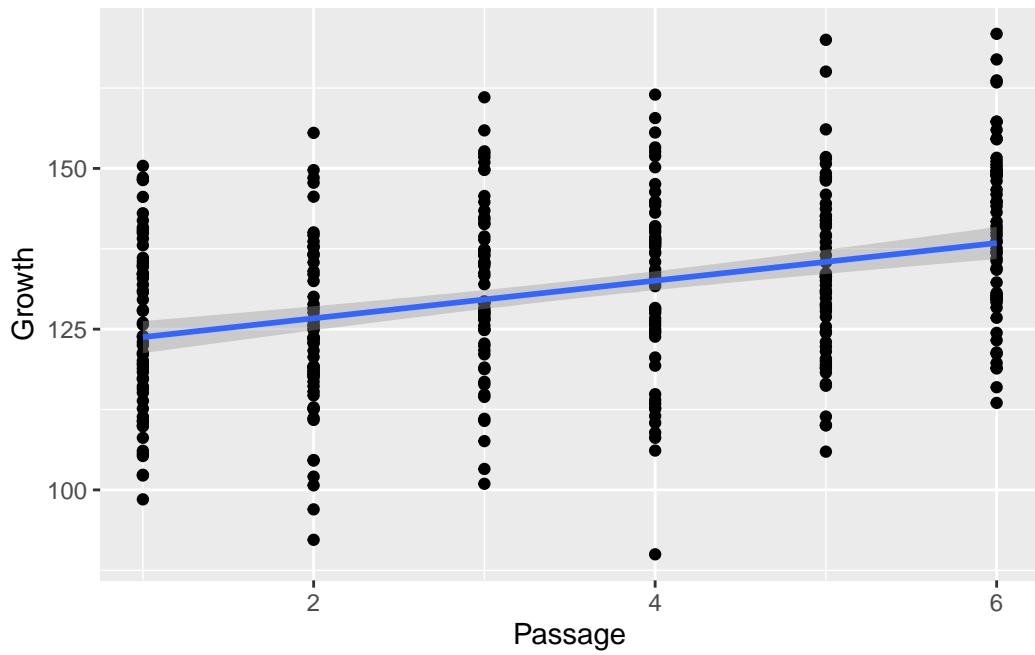

11.4.1 Linear regression

We will analyse the relation between independent variable (IV) Passage and dependent variable (DV) Growth.

11.4.1.1 Graphical exploration

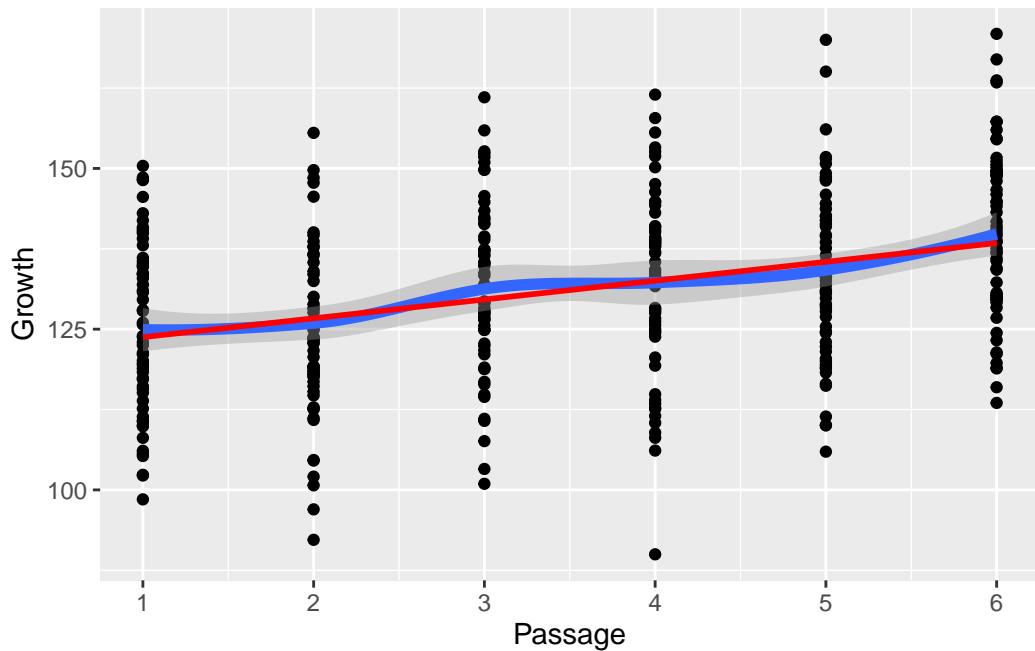

```
ggplot(rawdata,aes(Passage,Growth))+  
  geom_point() +  
  geom_smooth(method=lm)
```

```
`geom_smooth()` using formula = 'y ~ x'
```

```
ggplot(rawdata,aes(Passage,Growth))+  
  geom_point() +  
  scale_x_continuous(breaks=seq(0,10,1)) +  
  geom_smooth(lineWidth=2) +  
  geom_smooth(method=lm,se=F,color='red')
```

```
`geom_smooth()` using method = 'loess' and formula = 'y ~ x'  
`geom_smooth()` using formula = 'y ~ x'
```

11.4.1.2 Modelling

This takes 2 steps, building the model and computing p-values.

```
# model
(regressionOut<-lm(Growth~Passage,data=rawdata))
```

```
Call:
lm(formula = Growth ~ Passage, data = rawdata)
```

```
Coefficients:
(Intercept)      Passage
  120.834        2.927
```

```
# model and p.value for slope, not recommended
tidy(regressionOut)
```

```
# A tibble: 2 x 5
  term       estimate std.error statistic   p.value
  <chr>     <dbl>     <dbl>     <dbl>    <dbl>
1 (Intercept) 121.      1.63      74.2  1.77e-219
2 Passage      2.93      0.418     7.00  1.26e- 11
```

```
# computation of SSQs and p-values, use this!
(anova_out<-anova(regressionOut))
```

Analysis of Variance Table

```
Response: Growth
          Df Sum Sq Mean Sq F value    Pr(>F)
Passage     1   8996   8996.2  49.022 1.257e-11 ***
Residuals 358  65698    183.5
---
Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

```
anova_out$`Pr(>F)` #|> na.omit()
```

```
[1] 1.257266e-11           NA
```

```
tidy(anova_out)
```

```
# A tibble: 2 x 6
  term      df  sumsq meansq statistic  p.value
  <chr>    <int> <dbl>  <dbl>     <dbl>    <dbl>
1 Passage     1   8996.   8996.     49.0    1.26e-11
2 Residuals  358  65698.   184.      NA      NA
```

```
# summary(regressionOut)
# str(regressionOut)
```

11.4.1.3 Adjusting

To take out the variance due to Passage effects, we can use the residuals and shift them to the original mean:

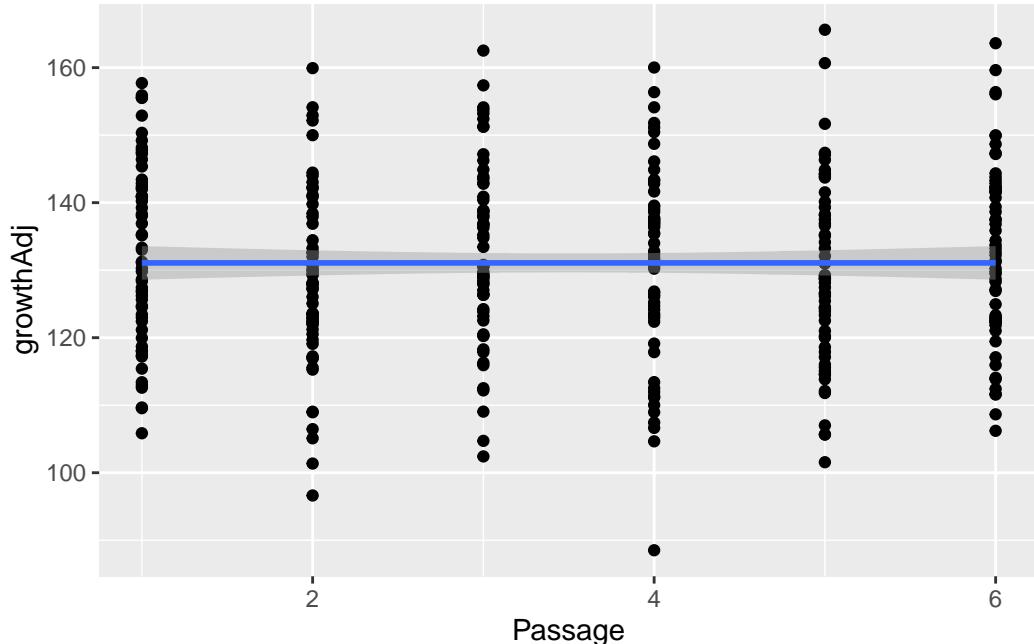

```
rawdata <-
  mutate(rawdata,
        growthAdj = regressionOut$residuals+mean(Growth))

  summarise(rawdata,
            across(contains('growth'),
                   ~meansd(.x,roundDig =4)))
```

```
# A tibble: 1 x 2
  Growth      growthAdj
  <chr>       <chr>
1 131.1 ± 14.4 131.1 ± 13.5
```

```
ggplot(rawdata,aes(Passage,growthAdj))+
  geom_point()+
  geom_smooth(method = 'lm')
```

```
`geom_smooth()` using formula = 'y ~ x'
```

```
lm(growthAdj~Passage,data=rawdata) |> tidy()
```

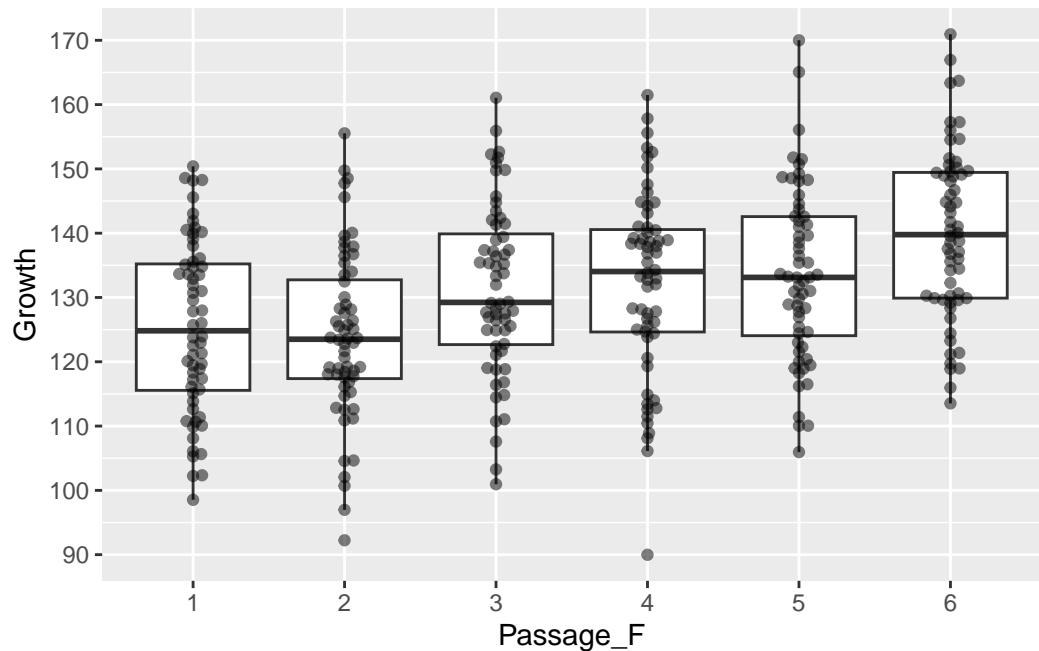

```
# A tibble: 2 x 5
  term      estimate std.error statistic   p.value
  <chr>        <dbl>     <dbl>      <dbl>    <dbl>
1 (Intercept) 1.31e+ 2     1.63     8.05e+ 1 2.04e-231
2 Passage      6.80e-15    0.418    1.63e-14 1.00e+ 0
```

11.4.2 ANOVA

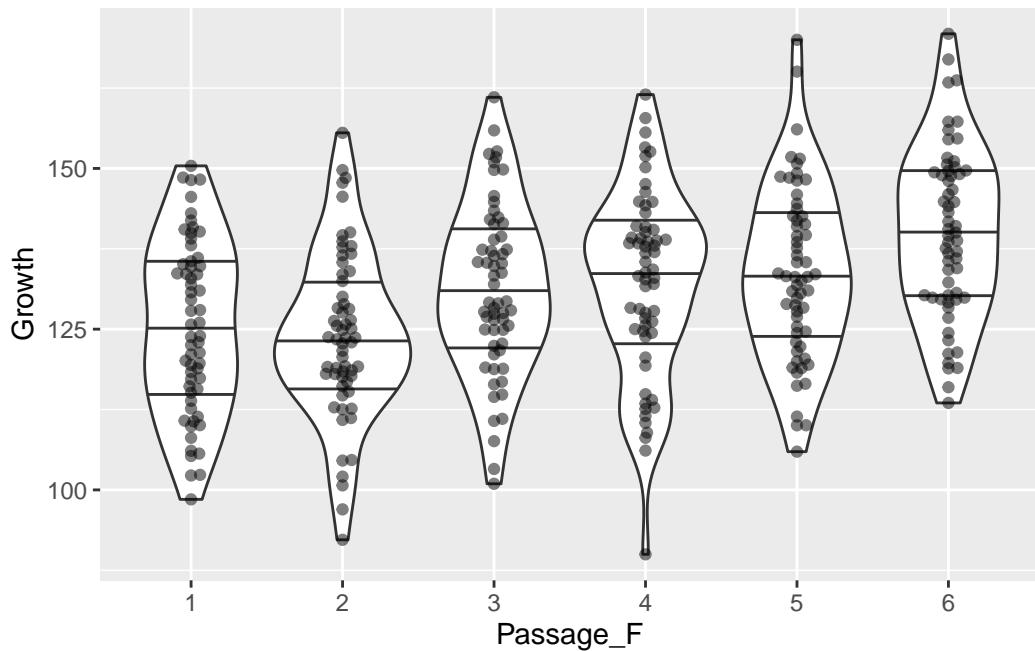

In the linear regression, we had Passage as a continuous IV, estimating a global ‘universal’ effect supposed to be constant. Now we look at Passage_F and model a discrete IV, allowing for specific effects, and thereby comparing means between groups.

11.4.2.1 Graphical exploration

```
ggplot(rawdata,aes(x = Passage_F, y = Growth))+  
  geom_boxplot(outlier.alpha = 0)+  
  geom_beeswarm(alpha=.5)+  
  scale_y_continuous(breaks=seq(0,1000,10))
```

```
ggplot(rawdata,aes(x = Passage_F, y = Growth))+  
  geom_violin(draw_quantiles = c(.25,.5,.75))+  
  geom_beeswarm(alpha=.5)
```

11.4.2.2 Modelling

```
(AnovaOut<-lm(Growth~Passage_F,data=rawdata))
```

Call:
`lm(formula = Growth ~ Passage_F, data = rawdata)`

Coefficients:

	(Intercept)	Passage_F2	Passage_F3	Passage_F4	Passage_F5	Passage_F6
	125.440	-1.467	5.824	6.801	8.156	14.520

```
tidy(AnovaOut)
```

```
# A tibble: 6 x 5
  term      estimate std.error statistic p.value
  <chr>      <dbl>    <dbl>     <dbl>   <dbl>
1 (Intercept) 125.       1.74     71.9  2.20e-213
2 Passage_F2  -1.47     2.47    -0.595 5.52e- 1
3 Passage_F3   5.82     2.47     2.36  1.87e- 2
4 Passage_F4   6.80     2.47     2.76  6.11e- 3
5 Passage_F5   8.16     2.47     3.31  1.04e- 3
6 Passage_F6  14.5      2.47     5.89  9.03e- 9
```

```
# summary(AnovaOut)
(t <- anova(AnovaOut))
```

Analysis of Variance Table

```

11.4.2.3 Post-hoc analyses

The p-value from our model only tests the global Null hypothesis of no differences between any group (all means are the same / all groups come from the same population). Post-hoc tests are used to figure out which groups are different. Those tests need to take multiple testing into account. Try to limit selection of tests!

```
# possible in a loop, but nominal p
t.test(rawdata$Growth[which(rawdata$Passage==1)],
       rawdata$Growth[which(rawdata$Passage==2)],
       var.equal = T)
```

Two Sample t-test

```
data: rawdata$Growth[which(rawdata$Passage == 1)] and rawdata$Growth[which(rawdata$Passag
```

```
t = 0.60679, df = 118, p-value = 0.5452
alternative hypothesis: true difference in means is not equal to 0
95 percent confidence interval:
-3.321297  6.255936
sample estimates:
mean of x mean of y
125.4396 123.9723
```

```
# all pairwise group combinations
pt_out<-pairwise.t.test(x=rawdata$Growth,
                         g=rawdata$Passage_F,
                         p.adjust.method='none')
pt_out
```

```

11.4.3 LM with continuous AND categorical IV

Traditionally you may think of *regression OR ANOVA*, but they are no different and can be combined. This is called a general linear model. Multivariable models may contain interactions between independent variables V $IV1*IV2$.

11.4.3.1 Graphical exploration

```
p0 <- ggplot(rawdata,aes(Treatment,Growth))+  
  geom_boxplot()  
p1 <- ggplot(rawdata,aes(Treatment,Growth, color=Passage_F))+  
  geom_boxplot()  
p2 <- ggplot(rawdata,aes(color=Treatment,Growth, x=Passage_F))+  
  geom_boxplot()  
p3 <- ggplot(rawdata,aes(Treatment,Growth))+  
  geom_boxplot()  
  facet_wrap(facets = vars(Passage_F), labeller='label_both')  
# from patchwork  
(p1+p2)/p3
```

11.4.3.2 Modelling

Models with (*) and without (+) interaction are build and tested.

```
lmOut_interaction<-lm(Growth~Passage*Treatment,data=rawdata)
Anova(lmOut_interaction,type = 3)
```

Anova Table (Type III tests)

Response: Growth

Sum Sq	Df	F value	Pr(>F)
--------	----	---------	--------

```

```

```
check_model(lmOut_interaction)
```

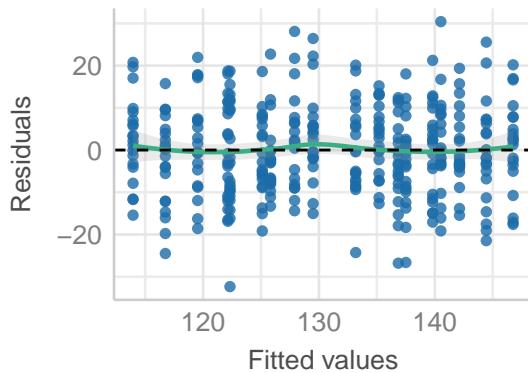

Posterior Predictive Check

Model-predicted lines should resemble observed

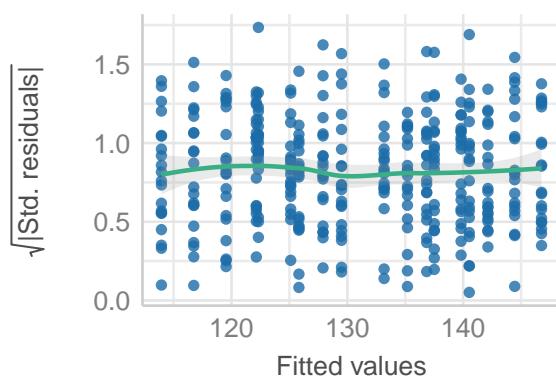

Linearity

Reference line should be flat and horizontal

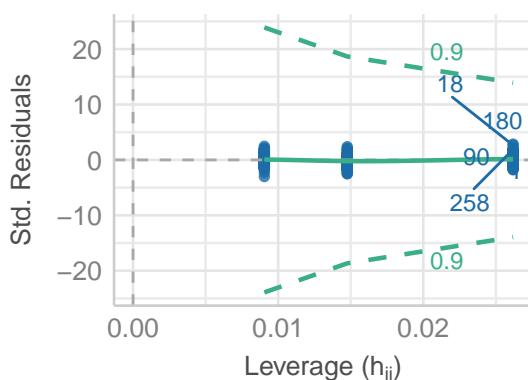

Homogeneity of Variance

Reference line should be flat and horizontal

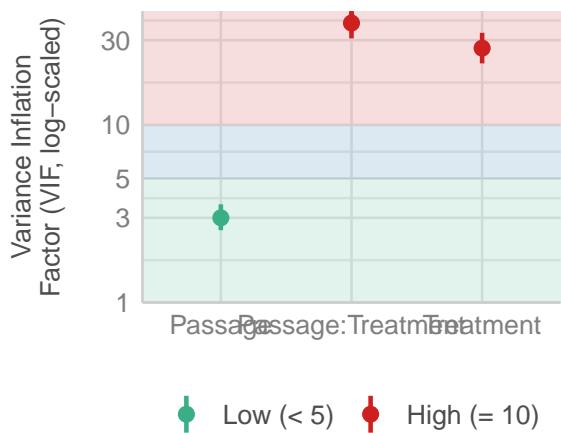

Influential Observations

Points should be inside the contour lines

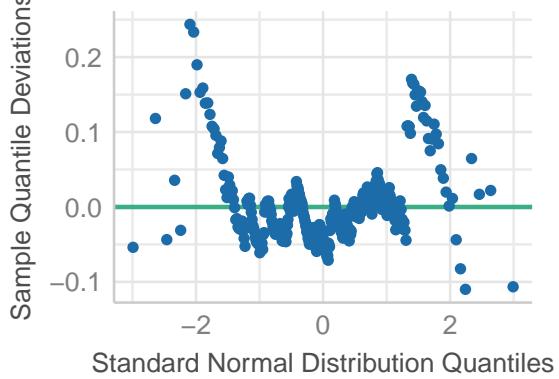

Collinearity

High collinearity (VIF) may inflate parameter uncertainty

Normality of Residuals

Dots should fall along the line

`dev.off()`

null device

12.4 How to specify interaction in multivariable models

```
# all possible interactions
(lm_out <- lm(mpg~(wt*gear*factor(am)*cyl),
              data=mtcars))
```

Call:

```
lm(formula = mpg ~ (wt * gear * factor(am) * cyl), data = mtcars)
```

Coefficients:

	wt	gear
(Intercept)	456.687	-146.900
factor(am)1		wt:gear
-180.550	-16.129	53.938
wt:factor(am)1	gear:factor(am)1	wt:cyl
63.239	102.915	10.048
gear:cyl	factor(am)1:cyl	wt:gear:factor(am)1
5.764	-33.954	-37.005
wt:gear:cyl	wt:factor(am)1:cyl	gear:factor(am)1:cyl
-3.593	8.905	3.456
wt:gear:factor(am)1:cyl		
NA		

```
# only two-way interactions
(lm_out <- lm(mpg~(wt+gear+factor(am)+cyl)^2,
              data=mtcars))
```

Call:

```
lm(formula = mpg ~ (wt + gear + factor(am) + cyl)^2, data = mtcars)
```

Coefficients:

	wt	gear	factor(am)1
(Intercept)	57.58968	-7.80045	13.91506
cyl	wt:gear	wt:factor(am)1	wt:cyl
3.13308	4.90387	-11.51010	0.06975
gear:factor(am)1	gear:cyl	factor(am)1:cyl	
2.23288	-1.43230	2.15419	

```
#some selected interactions
(lm_out <- lm(mpg~wt*(gear+factor(am)+cyl),
```

```
    data=mtcars))
```

Call:

```
lm(formula = mpg ~ wt * (gear + factor(am) + cyl), data = mtcars)
```

Coefficients:

	(Intercept)	wt	gear	factor(am)1	cyl
	50.53760	-8.43482	-5.80119	21.62110	-1.04500
wt:gear			wt:cyl		
	2.03447	-7.59198		-0.00499
